BURTON

CLASS "B" CONVERSION UNIT

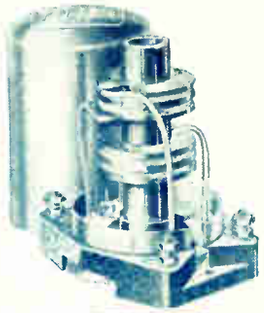
This unit is intended to be added to existing battery sets in order that moving coil reproduction may be obtained. It contains a specially designed driver and output transformer, and the whole unit is housed in a highly polished brown bakelite case. The unit takes an average current of 6 m.a. and is capable of delivering 2 watts output without distortion

Made by C. F. & H. BURTON, Progress Works, WALSALL.

35/-

TELSEN

Intermediate Frequency TRANSFORMER COILS



Specified by the designer of the "Wireless World" NEW MONODIAL SUPER. Ideal for every superhet where lasting efficiency is the first essential. Totally screened. The world's finest value at the new reduced price of **7/6**

TELSEN FOR EVERYTHING IN RADIO

Announcement of the Telsen Electric Co., Ltd., Aston, Birmingham.

D.C. AND A.C.

AMPS VOLTS OHMS

BRITISH MADE

EVERY TEST WITH **ONE** COMPLETE INSTRUMENT

The Avometer is the only complete testing instrument which gives *direct* readings in amps, volts and ohms without the necessity for mathematical calculations. It is indispensable to the Service men of leading radio manufacturers as the only instrument that adequately meets their needs.

Two models, one for D.C. only, 8 GNS. and the Universal Avometer giving both D.C. and A.C. readings (50 cycles) 12 GNS. Deferred Terms if desired.

Illustrated Pamphlet post free.

NOW YOU CAN BUILD A SET FOR BOTH A·C & D·C MAINS

Tungsram produce an A.C.—D.C. Universal Valve

Tungsram have achieved it—a Universal Valve which works on both A.C. and D.C. mains.

With these Tungsram Universal Valves any circuit can be built. All valves, including rectifier, are indirectly heated—there is practically no hum—and they are really economical, for the mains consumption is only 35 watts.

Your dealer stocks them—go to him to-day! Or post the coupon for full particulars and circuit diagrams.

THERE IS A TUNGSRAM VALVE FOR EVERY RADIO NEED

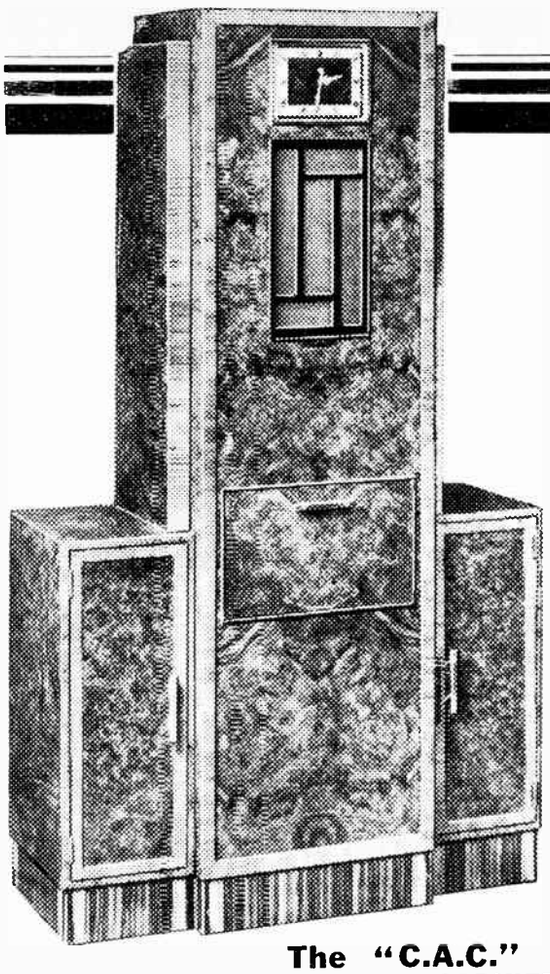
PROGRAMMES CONTINUED



C.A.C. comes over the "Border"

An Apology

We would ask the kind indulgence of those Readers whose enquiries are awaiting detailed replies. Most of these outstanding enquiries are of an involved nature, requiring special costings and specifications. They are, however, being dealt with as rapidly as possible. **We are, however, still maintaining our definite policy and promise regarding deliveries and all orders are executed by return.**

"C.A.C." CABINETS, KITS & SETS are not strangers to Scotland, but this is the first time we have brought a complete display for the inspection of our Scottish friends. When you visit the

GLASGOW RADIO EXHIBITION

you will receive a warm welcome at our

STAND No. 2A

"C.A.C." has been associated with the radio industry since its inception and throughout its ever-changing conditions "C.A.C." has kept intimate touch with every development, determined to offer to the public only products which embody the most advanced ideas in Radio technique.

Its position is unique in many ways. The Technical Staff is second to none in the country. As Technical Consultant, "C.A.C." has obtained the services of Mr. W. I. G. Page, B.Sc., the well-known designer until recently on the staff of "The Wireless World," and whose reputation in designing sets of ultra-modern technique is widely known. The Radio Manufacturing Department and the Cabinet-making side of the business are now housed in a large modern Factory, and the most up-to-date machinery, covering an area of about 13,000 sq. feet, has been installed.

This happy and unique combination of highly specialised Receivers, built into the best that Cabinet-makers' craftsmanship can produce, is sufficient to ensure that only Receivers of outstanding performance and appearance will be offered to the public.

Trade Enquiries Invited.

The "C.A.C." GRANDFATHER CLOCK CABINET

This handsome and original piece of furniture represents the very last word in Radio gramophone Cabinet design and has proved one of our most popular selling lines at Olympia. There is provision for accommodation of almost any type of Receiver, whilst the Gramophone motor and Pick-up fit into the sliding compartment below. The two side compartments allow for the storage of gramophone records or can be fitted as a cellarette, etc. Price **14 GNS.**

THE "C.A.C." PENTAGRID SUPERHET

A four-valve A.C. Superhet of highly specialised technique using a Pentagrid Converter as a single-valve frequency changer, which performs the dual functions of oscillator and first Detector in the most efficient manner known. In the I.F. stage a variable-mu Pentode is used, which adds its contribution to A.V.C. The third valve is one of the new double Diode Pentodes, which gives almost perfect automatic volume control, and the fourth valve is a Catkin Pentode. The output is in the order of 2½ watts, whilst the sensitivity of this Receiver is a revelation. The four special valves give an overall performance equal to that of any six-valve superhet on the market.

KIT "C." Complete with Valves, Cabinet and Loud Speaker (less Batteries) - **£13-9-3**

CABINET, beautifully finished in Figured Walnut exclusively specified by the designer and manufactured in our own factory - - **£1-12-6**

(Front drilled, if desired, without extra charge.)

CONSTRUCTION

We shall be pleased to undertake the construction of the above receivers to customers' own requirements. Only highly skilled technicians, under the personal supervision of Mr. W. I. G. Page, B.Sc., are entrusted with this work. This ensures that the results obtained by the designer will be duplicated.

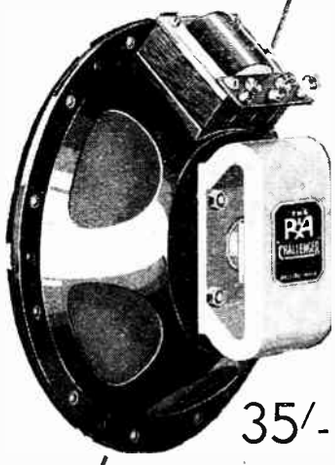
Achievement!

The success of the new R. & A. Reproducers has exceeded all expectations. The world famous Challenger is now available in 5 models, and the new Alpha P.M.M.C. Reproducer, introduced at Radiolympia, has evoked the highest praise. If you desire the finest possible reproduction of broadcast speech and music, you must have an R. & A. Reproducer.

The 1934 'CHALLENGER' SERIES

The CHALLENGER series 1934 comprises 5 models; a type for every output, and CHALLENGER performance needs no comment; its reputation is world-wide.



Standard Model for use with Super Power and Pentode Outputs. Includes 3-ratio Transformer.

35/- COMPLETE

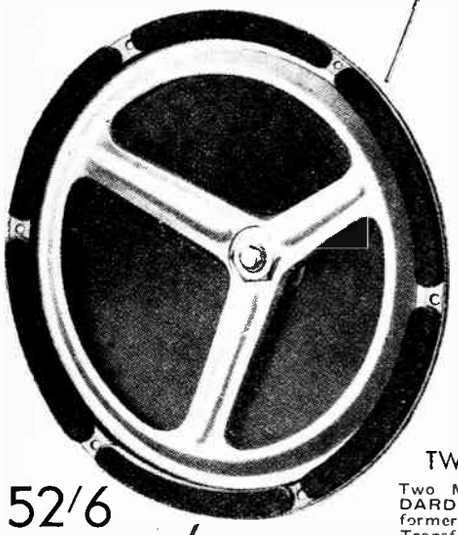
OTHER 'CHALLENGER' MODELS—

TYPE "B" for Class B Amplification. (B8 for Cossor, and B15 for Mullard and Mazda Class B Valves.)

" "P" An extension Instrument for Commercial Receivers.

" "Q" for Quiescent Push-Pull. (15,000 ohms Plate-to-plate Load.)

The Triumph of the R. & A. 'ALPHA'



The success of the new ALPHA P.M.M.C. Reproducer has been overwhelming. Its ingenious construction (protected by Letters Patent), and its amazing fidelity of reproduction have fired the enthusiasm not only of the Trade, but also of the thousands of spectators at Olympia who heard this remarkable reproducer demonstrated. Its immunity from damage, ingenious system of diaphragm support and brilliance of reproduction is an outstanding achievement. It handles inputs as high as 7 watts undistorted A.C. without distress.

52/6 COMPLETE

TWO MODELS

Two Models are available—STANDARD MODEL with 6-ratio Transformer, and MODEL B, with Universal Transformer for Class B operation. Diameter, 10½ in.; depth, 5¼ in.; weight, 8¼ lb.

Write for new leaflet of the complete range of R. & A. Reproducers and ask your dealer to demonstrate.

OLYMPIA's centre of attention was the LION EXHIBIT

Olympia's most outstanding Exhibit was the Lion H.T. Battery Stand. Never has there been such an exhibit—never have you had such an opportunity of SEEING quality being built into the Batteries you use. You could see for yourself the up-to-date machinery, the modern-as-the-minute methods. It was proof positive of the claims of the Lion H.T. Battery that it is definitely the finest battery made.

Next battery you buy . . . be sure it is a Lion. It will give you MORE power and you will pay LESS for it.

MAINS APPARATUS for every purpose!

Units, Transformers, Chokes and Amplifiers

NEWS!

Two special Portable Amplifiers suitable for speech ampification in small halls, Models H.5 (5 watts) at £19 10s., and H.10 (10 watts) at £23 5s. nett. New Mains Transformers include three for use in Chargers employing Philips Rectifiers, and three for use with the new Westinghouse HT. 12 and HT. 13 Rectifiers. Models AO. 2 and AO.3 Home Battery Chargers have been redesigned. Mains Units and Assembled Kits retain the same outputs at the same prices but minor improvements have been effected which should make them even more popular.

Because Heayberd have been specialising in the production of Mains Apparatus since broadcasting began; because Heayberd components and mains units have been specified and used by leading designers all over the country; because only the best British materials are used in the manufacture of Heayberd products: and because the design and construction of all Heayberd apparatus is technically sound—it will pay you to ask for Heayberd when ordering Mains Components. Write TO-DAY for full information.

EDITORIAL COMMENT

Broadcasting Hours

Are They Too Long?

A RECENT Leader in which we called attention to the unwarranted amount of criticism levelled at the B.B.C. programmes has brought us a number of letters from readers, one or two criticising us for championing the B.B.C. programme policy, but the majority endorsing heartily our point of view that much of the criticism of programmes is undeserved. We take note, in particular, of the remarks of one correspondent, who, whilst agreeing that the average of the programmes is good, contends that the task of maintaining good programmes over so many hours is a well-nigh impossible one and consequently we cannot expect to avoid the probability that some portion of the matter sent out will be of poor standard.

We have ourselves from time to time in the past raised the question as to whether the B.B.C., in compiling new programmes for so many hours, is not setting itself a rather impossible task. Separating entertainment and the talks from those portions of the programme which may be regarded as service, it would seem that there is room for a certain amount of repetition without spoiling the present character of the programmes. The alternative programme scheme seemed to pave the way for economies of this nature, for we could then have a first-class programme repeated from other stations on different evenings of the week. If this repetition never takes place many fine broadcasts are missed by a proportion of listeners because their other engagements have made it impossible to listen-in at the particular time the broadcast took place. To have a second chance of listening-in to all the more important broadcast performances would be an undoubted benefit to listeners in general. It would, incidentally, reduce the number of hours when fresh material had to be provided for broadcasting, and it is possible that in some instances it would be permissible for "repeat" performances to be carried out through the medium of records of the original transmission.

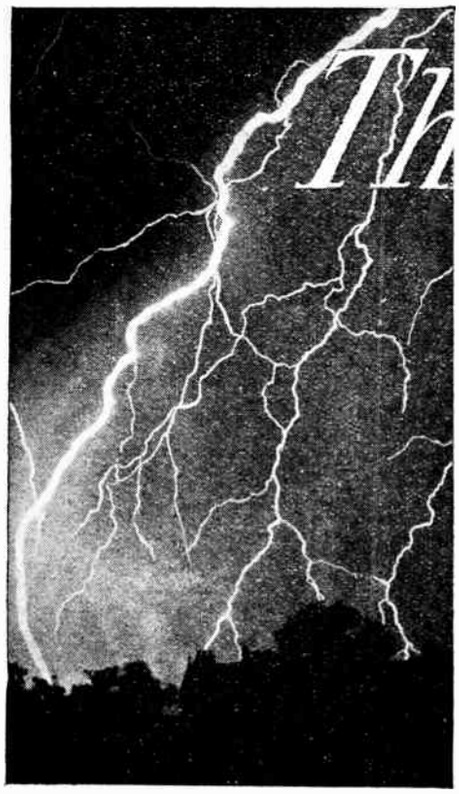
Television Post Cards

The Purpose of the B.B.C.

WE mentioned in last week's issue that the request which is now being made to those who see the broadcast transmissions to send a post card to the B.B.C. is for the purpose of arriving at some idea of the size of the television audiences of these broadcasts.

This action on the part of the B.B.C. is, we understand, a direct result of a suggestion put forward by *The Wireless World* some time back that it was of importance to everyone concerned in the development of television in this country to have this information.

We have noticed that in certain directions this action on the part of the B.B.C. has been interpreted as being intended to provide an excuse for the B.B.C. to discontinue the transmissions when they find that they have a very limited audience. We do not think that there is any reason to feel anxiety on this score. The B.B.C. has a contract to continue these transmissions for some considerable time to come and, in any case, it is obviously absurd to suppose that if there was sufficient justification for starting a year ago, there is any excuse for stopping transmissions now, at a time when so many new developments seem likely to emerge shortly from the experimental stage.



Thunder and Lightning

How Wireless Aerials are Affected

By J. F. HERD, A.M.I.E.E.

AERIALS were at one time popularly believed to act as a kind of collector of lightning discharges. Experience shows that aerials are very rarely struck during the thunder season in comparison with the number of lightning discharges that take place. This summer has proved to be no exception.

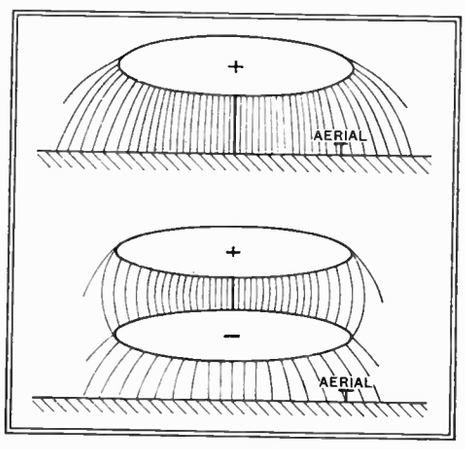
THE thunderstorm season has been and is still with us and appears, from newspaper accounts, to have had its usual crop of things, including aerials, "struck by lightning." This always serves to remind us—at least to remind me—how extremely little we know yet about this, one of Nature's oldest and most magnificent phenomena.

Whether he likes it or not, the wireless enthusiast is compelled to affect some interest in thunder and lightning, since lightning discharges are believed to be the cause of most if not, indeed, all of those atmospherics which so often militate against summer-time reception, especially on the longer wave band. In passing, too, it is to be recalled that Popoff—a Russian scientist, not the perhaps better-known character in "The Merry Widow"—actually used an elevated aerial to observe the effect of distant thunderstorms, wireless atmospherics, a year before Marconi used the same arrangement to radiate controlled wireless waves.

Isolated Targets

Although the daily press reports grizzly details of things struck by lightning, it is surprising how rarely this occurs and how little damage is done by these amazing impulses. Incidentally it is very noticeable that wireless aerials are by no means readily struck. Many Jonahs of a few years ago regarded every aerial as a potential collector of lightning flashes and envisaged them being struck in their thousands. One simple explanation is obvious. It is that the *average* domestic broadcast aerial is not incomparably high with regard to its surroundings, and is therefore in no greater prominence from the point of view of attracting, as it were, a concentrated field to facilitate a discharge path. It is well known that a single tall tree, standing, for example, in splendid isolation in the middle of an open space is one of the worst forms of shelter that one can seek from rain in a thunderstorm. In such a case there is a definite possibility of the tree acting in the manner described, while, once it *is* struck there is the well-known possibility of "side-flashing" from the trunk of the tree to persons standing beneath its shady boughs. It is side-flashing of this type which is always the danger to the vicinity when any object is struck by lightning.

The same erratic tendency is seen in the lightning flash itself, giving the zig-zag appearance so familiar. These erratic tendencies can be observed in artificial high-voltage discharges—discharges much less in intensity than those produced naturally. For example, watching successive flash-overs at the National Physical Laboratory high-voltage plant, the erratic nature of the path can be seen changing even during one flash-over. The longer zig-zag path—rather than the straight and narrow one—is due, apparently to differences of ionisation in different parts of the air, causing the longer geometrical path to be, from the electrical point of view, the shorter.



Showing how an intense electric field may be built up about a wireless aerial due to a thundercloud, even when the aerial is not in or near the path of the final discharge which is shown in heavy line.

It is interesting to consider the enormous electrical quantities contained in a lightning flash. It is, of course, impossible to make any direct measurement of the effective current in the discharge itself, but it is possible to infer typical values from its effect on circuits and instruments of known electrical dimensions at known distances from the flash.

The classical work on this subject is that of the Cambridge scientist, Prof. C. T. Wilson, who has estimated that the potential reached in a thunder cloud just before the discharge is of the order of one thousand million (10^9) volts. Professor Wilson has also estimated that the discharge involves a displacement of the order of 20 coulombs in a period about one thousandth of a second, giving a mean current of about 20,000 amperes. This is, of course, the average value during the time of the discharge and must be greatly exceeded at some process of the discharge. It appears possible that instantaneous values of over 100,000 amperes are reached. The electrical power associated with a lightning flash is thus several thousand kilowatt hours. All of this energy does not, of course, appear at the earth's surface, since much of it is used up in the air channel. Many of the most powerful strokes, however, must deliver a large proportion of their energy to the earth.

A fairly reasonable domestic load for all lighting and a number of electric power appliances works out at between 1,500 and 2,000 kilowatt hours per year, so that a single lightning discharge has enough energy to keep a modern suburban dwelling fully electrified for about a couple of years. No wonder things happen when this supply is released in a thousandth of a second!

The above figures of current and voltage help to explain such things as the side-flashing already mentioned. For example, in the case of the simplest lightning conductor the wire may have to carry a current of well over 20,000 amperes, so that every ohm of resistance in it has a drop of over 20,000 volts across it. A local resistance or bad connection, or a

Thunder and Lightning.—bad earth amounting to ten ohms may thus raise the potential to well on towards a million volts. Apart from the heat developed at the resistance, this will give definite tendencies to side flash if the discharge can gap over a length of air which is easily ionised and made conductive.

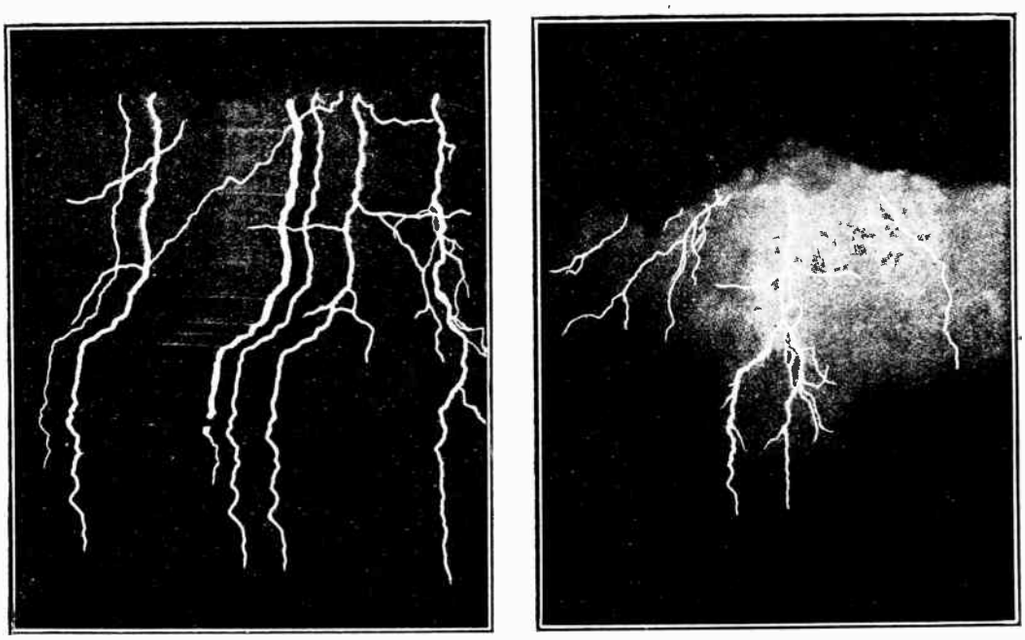
In the case of a wireless aerial acting as an involuntary lightning conductor, the presence of anything giving a high impedence to earth would thus explain the various erratic things that have been described in cases where aerials have been struck. In a case described in one well-written technical account, which the writer had the chance of seeing, a series aerial condenser was completely shattered for reasons which are obvious from the above argument. The inside of the set was described as looking as if it had been sprayed liberally with pitch. Side flashing also occurred from the aerial to a lead base round the chimney stack, and at two different places in the wall beside the down lead.

It is well known that some lightning discharges take place between cloud and earth while others occur from cloud to cloud. This is quite apart, of course, from the so called "summer lightning" when the sky is widely illuminated, especially towards the horizon, by the reflected effects of flashes that may be many miles - even a hundred miles—away. Experts are not agreed as to the proportion of lightning flashes which are of the cloud to earth or the cloud to cloud variety. Neither are meteorologists fully agreed about the exact mechanism which gives rise to the thunder cloud and its enormous electrical charges. Although this would appear to have a distinct bearing on the nature of the discharge. Despite the small number of earth-surface casualties that occur (in relation to the total number of lightning flashes) one has the impression that there have been more such casualties this summer than one usually sees reported.

We are Still Learning

Does this then mean that these summer lightning-storms have been characterised by a greater number of cloud-to-earth strokes, or is it just bad luck? The wireless investigation of atmospherics is, of course, helping to cast light on thunderstorms, and wireless methods are now available for revealing both the place of origin and the nature of the impulse received at a distance. At the last N.P.L. annual invitation visit, a cinema film was exhibited showing the cathode-ray direction finders which reveal the direction of individual atmospherics. It has been estimated that taking the world as a whole there are about 1,000 lightning discharges per second at any time. The figures of kilowatt hours thus wasted during the course of a year simply do not bear thinking about.

Apart from the case of an aerial being directly hit by lightning there are still possibilities of considerable inductive effects due to lightning. During the process of building up a thundercloud there are very considerable electrostatic fields created between cloud and earth. This can be seen from the diagram on the previous page. Here an aerial can be in an intense electric field even though it is not below the point where discharge finally occurs. Even in the case of what ultimately becomes a cloud-to-cloud discharge, not hitting the earth at all, immediately prior to the discharge the lower side of the cloud nearer to the earth gives rise to extremely high electric fields at the surface of the earth. These fields, even although they are static or in the process of slow building up, will obviously have an effect on aerials in their vicinity. When the aerial has a low d.c. path to earth this does not matter, but a series condenser giving a high resistance d.c. path to earth may get uncomfortably charged. A series air condenser in a big aerial can often be seen to spark due to this cause. In either of these cases the sudden destruction of this electric field (due to the discharge taking place) gives rise to the induction of a big transient voltage in the aerial. This is, of course, the very strong atmospheric which is heard when a visible flash occurs, and even with many that are not actually visible but where the aerial is nevertheless within the extensive region that has come under the wide scope of this electrostatic field. In addition to this more or less local effect the sudden destruction of this field has the effect of setting up an electromagnetic wave which travels out into space in the form of an atmospheric —a natural signal sent out by a powerful transmitter with an excellent large radiating aerial!



Photographs of a lightning flash, the left-hand picture was taken by camera moving from right to left; the right-hand picture is of the same flash taken by a stationary camera.

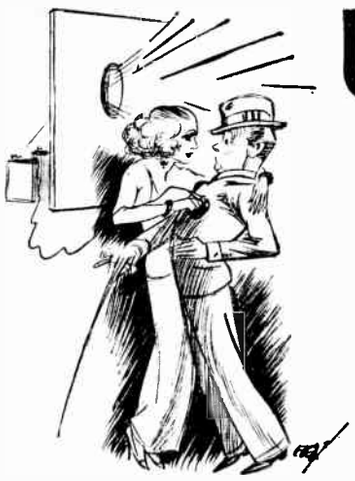
Protecting the Aerial

Despite the few cases of wireless aerials being struck by lightning, there seems no doubt that protection of the domestic aerial from the effects of lightning—even from the relatively minor induced charges just described—is a real and wise precaution. Many earthing devices exist, and most outdoor aerials are fitted with *some* such device. For the best protection it is usually recommended that the earthing switch should be outside the house and suitably protected against weather. This unfortunately results in it not being used, particularly as a routine method overnight or when the house is unattended. Some meticulous citizens might manage to remember it, but one fears that the average man is rather casual about it. The next best technical solution, and one much more likely to be used, is to have an indoor switch immediately at the point of entry. Best of all however, is an automatic device which needs no switching, and gaseous conductors are now available for the purpose, fitted usually, with the familiar serrated edge spark gap or "lightning arrester." In fitting the aerial, too, precautions may be taken to minimise the possibilities of side-flashing. Broadly, these can be summed up in the form of keeping down resistance and inductance of down-leads and even more, of earth-lead. Sharp bends in the down lead should be avoided, and the earth-lead should be as short and straight as possible—as indeed it should be in any case.

There is very little chance of an indoor aerial being struck unless the whole house "gets it." Induced voltages of the type described, are still set up in an indoor aerial, but switching protection is hardly necessary except in the very nearest of discharges.

UNBIASED

By FREE GRID



Accelerating the heart beats.

Reminiscences

EVERYTHING this year seems to have militated against my getting a view of the Olympia Show, and if it had not been for the solace afforded by *The Wireless World* Show Report I should have been plunged into a barren sea of utter despair. I have already told how the carelessness (or carefulness?) of a van driver outside Olympia laid me low when I was just in sight of the Delectable Country. Thereafter, from my sick-bed I tried to obtain first-hand day-to-day Show reports, but was thwarted by the fact that the little Grid Leaks, the only people I could have relied upon, were away at a wretched holiday camp in the wilds of Central Europe. Ultimately I had to fall back on the services of Mrs. Free Grid, of whom I will say that she did her best. She provided me with a sort of "bird's"-eye view.

Among other things she reported a truly distressing lack of grammar on the part of the exhibition authorities, since, over every entrance door, was printed a large sign: "NO PASS-OUTS." The expression "pass-out" is uncouth enough without such a glaring mess-up in the plural.

Apparently the most spectacular exhibit, notwithstanding the B.B.C. show, was that provided by the General Post Office, and I was rather pained to hear that a thing that attracted most people to the G.P.O. section savoured more of a side-show at Hampstead Heath on a Bank Holiday than a demonstration at a serious scientific exhibition. This was an apparatus for reproducing heart-beats on a loud speaker, where the microphone was held in the cardiac region. The arrangement, I was told, was superintended by a damsel who applied the microphone to the chests of young men and demonstrated how her close proximity accelerated their heart-beats.

I was grieved to learn that the Show revealed one of the features which disgraces certain other exhibitions held at Olympia, at which it is quite impossible to proceed from stand to stand without being followed by a parasite in the form of a part-exchange dealer pestering one with the enquiry: "Thinking of making a change, sir?"

Two or three young men at the Radio Show were armed with forms which, after requesting details of a set which an intending customer might think of exchanging in part payment for a new one, asked the singularly naïve question: "Is the tone, sensitivity, and selectivity of your present set good, bad, or indifferent?" Do the mutts honestly think that, faced with such a question, the customer is going to cry "Stinking fish"?

Big Business

I REALLY think that when it comes to exhibitions the wireless people must be the envy of every other industry in the country; in fact, judging by the way the business flows in at Olympia, I cannot for the life of me see why they keep the Show open for more than one day, or at the outside two; and neither can I understand why every business man in the country doesn't sell out all his other interests and get into the radio business without delay.

One well-known firm, with a factory many acres in extent, stated that they sold the whole of their output up to Christmas time before the Olympia Show was an hour old. Quite a number of firms nearly equalled this record, and one firm of international repute exceeded it, for they announced that during the run of the Show they had sold all their factory output for two years.

I do seriously think that, for the good of the radio industry generally, this blatant bunk ought to be suppressed.

Those Crystal Sets

I HAVE been overwhelmed in such an avalanche of letters and offers of help as the result of my note the other week concerning the dearth of crystal sets and parts thereof that I scarcely know how to thank readers. Not only did I receive letters giving me the addresses of numerous establishments where I could still buy

At knock-out prices.

crystal sets, but a large number of readers were kind enough to search over their old discarded radio gear and send me bits and pieces sufficient to make a very handsome crystal set.

In addition, many others offered me complete sets at knock-out prices. I am astonished to learn that they do exist in quite considerable quantities in various shops. One well-known dealer in wireless gear whose establishment I overlooked in my original quest, although it was well known to me, forwarded me his catalogue showing that the humble crystal set is still listed. I must confess, however, that I was considerably astonished to hear from the Editor that a well-known London firm had written to him stating that they sold over one thousand gross of crystals during the last radio season, more especially since another well-known crystal expert has written to inform me that, so far as he is concerned, the crystal trade has dwindled to vanishing point. Still, we live and learn.

A Souvenir

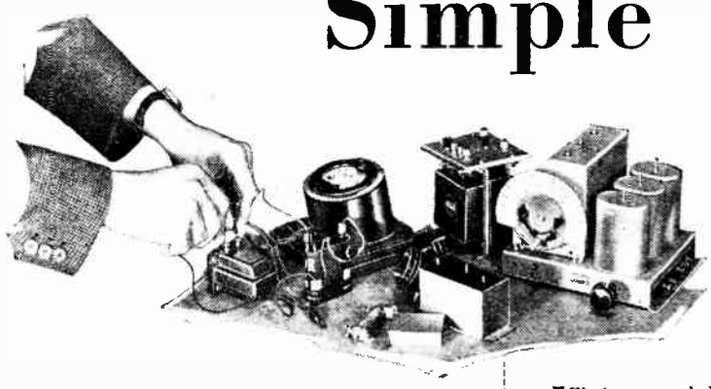
WOMEN never seem to be able to go anywhere, even for a day's visit, unless they bring back a wretched present or souvenir for somebody at home, even if

Functions beautifully.

it only be a paltry china ornament with "A Present from Margate" scrawled on it in gold letters, and Mrs. Free Grid's visit to Olympia was no exception. In this case, however, it was an extremely useful present, consisting of a volume control which is mounted on a weighted strap for slinging across the arm of the fireside chair in much the same way as certain ash-trays. The volume control functions beautifully, the "control" being spread nicely over practically the whole movement of the knob instead of crowded up at one end as in the case of some of them.

Everything in the garden was lovely until I became so satisfied with my present that I wished to buy another. I need scarcely say that, as is the way of all women, Mrs. Free Grid had completely forgotten the name, or even the exact locality, of the stand whence she bought it. The result is, of course, that my desire to possess a spare one has increased a thousand-fold; indeed, it has almost assumed the dimensions of the cravings of a drug-addict.

Simple Measurements on Receivers and Components



IT is essential to be able to make simple measurements and tests on a receiver before being certain that it is being operated under proper conditions. Quite an inexpensive instrument is capable of imparting to the skilful owner much valuable information.

Many Uses of an Inexpensive Meter

By S. O. PEARSON, B.Sc., A.M.I.E.E.

A MODERN wireless receiving set is unquestionably a somewhat complicated piece of electrical apparatus, with many components, each of which must function properly if the set is to give the best results. The valves, of course, are the most important of these components, and, even though they may be faultless, their efficient operation and their span of useful life depend on the correct voltages being applied to their various electrodes. For instance, if a grid bias voltage is too low the anode current may be excessive, and, apart from the lowering of efficiency and the introduction of distortion, the emitting cathode of the valve itself may be impaired.

It is perhaps a little surprising to find how often the electrical conditions prevailing in the circuits of a newly constructed receiver are left to chance, even by those who exhibit quite a high degree of skill in constructing their own sets, either from specifications such as those given from time to time in *The Wireless World* or from designs of their own. The assumption is commonly made that, the greatest care having been taken in following the constructional data, and in making theoretical calculations, everything is bound to be well from the electrical point of view! This may be so to a certain extent in many cases, but how much trouble and doubt may be avoided if only a simple measuring instrument such as a milliammeter were available.

Testing a New Set

When the set is completed and the valves are carefully put into their sockets comes the thrilling moment when the first trial is to be made, and the final adjustments effected. It is particularly at this stage that the possession of at least one meter is of the greatest value in enabling rapid and correct adjustments to be made and possibly in preventing damage to one or more of the valves. For even in the hands of the most skilful constructor it is possible for an error to occur in the wiring, or a short-circuit somewhere in the set—no one is infallible. Without the use of a meter it is possible that the fault would only be found at considerable cost.

Faulty components at times cause a deal of trouble, and with the aid of a suitable meter many can be tested before being built into the set. What is more distressing than to discover a faulty component in a more or less inaccessible part of a completed receiver?

Finally, there is the question of maintaining a receiving set in good working order, and here again the possession of a meter is of the greatest value, whether the set be a home-constructed or bought one. There comes a time when the performance of the receiver shows signs of deteriorating and the trouble must either be found by the owner or the set be sent away to an "expert." One need not dwell on which will be the less costly procedure! If it is a battery set maybe the H.T. battery is running low, maybe not—a meter would tell. Perhaps one of the valves is losing its emission—a meter would show which, and the faulty valve could be replaced accordingly. If the receiver were sent away to be serviced it is quite likely that a complete set of new valves would be recommended, and the owner would have no means of disputing the soundness of the advice. It is very commonly argued by the servicing agent that if one valve is deteriorating the remainder will follow very shortly, but this is by no means the case.

From all points of view the acquisition of at least one reliable meter is sound economy.

The Best Type of Instrument

In view of the foregoing remarks a brief survey is given below of the most suitable meter or meters to procure and the most useful applications. Without doubt the most serviceable instrument, if only one is to be purchased, is one with both milliampere and voltage ranges, preferably of the moving-coil type. Miniature moving-iron instruments, especially of the polarised type (that is, with definite positive and negative terminals), are, however, quite suitable, though usually not quite so accurate as the moving-coil type; and moving-iron voltmeters take a comparatively heavy current. The actual instrument chosen must, of course, depend on the depth of the purchaser's pocket, but it should be realised that even a cheap meter costing only a few shillings is most useful and enables a great many tests to be made. After all, the price of a meter is only a fraction of the cost of the receiver itself, and will without question pay for the outlay in a comparatively short time. Of course, the best policy is to buy the best meter one can afford.

The question of the most suitable ranges to choose for both milliamperes and volts depends to a large extent on the type of the receiver; for instance, whether it be battery or mains operated. The milliampere range should be a little greater than the anode current of the output valve, and the maximum voltage range must be a little above the H.T. voltage required by the set. Taking as an example a battery set requiring 100 volts H.T. and consuming normally 15 to 20 milliamperes, a suitable meter would have a voltage range of 120 and a current range of 24 milliamperes. (The combination of 120 volts and 24 milliamperes is a practical one because 24 is a multiple of 120, so enabling the same scale divisions to be used for both ranges.) A low-voltage range, say, up to 12 volts, would be of great value for measuring filament voltages, low-tension battery and grid bias battery voltages. This would be in addition to the 120-volt range.

Naturally, a useful arrangement is to have a separate voltmeter and ammeter, each with two or more ranges. In purchasing a voltmeter, choose where possible an instrument with the highest resistance in ohms per volt. A voltmeter with a resistance of 100 ohms per volt would take a current of one-hundredth of an ampere

Simple Measurements on Receivers and Components—

or 10 milliamperes with full scale deflection *on all ranges*. Voltmeters with lower resistance than this take more current and in many circumstances render satisfactory voltage measurements difficult.

Readers with a working knowledge of Ohm's law and a little skill in the winding of resistances will agree that a single sensitive or low-reading milliammeter can be made to operate over various current and voltage ranges by using it in conjunction with different parallel (shunt) or series resistances respectively. Instructions for extending the ranges of such an instrument were given in *The Wireless World* of January 29th, 1930. It should be realised that the actual movement of the instrument is identically the same for a voltmeter as for a milliammeter—it is only the equivalent resistance of the combination and its method of connection to the circuit that determines its function.

Testing of Components

Although good components can be relied upon to conform to the makers' rating within a fair degree of accuracy, it is, nevertheless, advisable to check some of the more important ones where facilities permit and where the test is practicable with the milliammeter or voltmeter available.

One of the most useful applications of a meter is the checking of individual components by simple tests before inclusion in a set under construction, or of suspect components in a set which has failed to give satisfactory results. For instance, simple tests can be made for continuity of circuit through resistances, coils, and transformer windings. It is only necessary to connect a meter in series with the resistance or coil under test and apply an appropriate voltage to the ends of the circuit so formed. If current flows there is no break in the circuit.

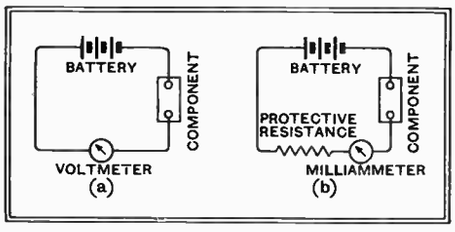


Fig. 1.—Simple test for continuity of circuit through a resistance or other component. A voltmeter should be used for preference as at (a), but a milliammeter may be employed if a safety resistance is included as at (b).

It is most strongly advised to use a *voltmeter* for this purpose to guard against the flow of excessive current when the component being tested has low resistance —a voltmeter has high resistance and cannot be damaged if the voltage of the testing battery used is not greater than the range of the instrument. The circuit arrangement is shown in Fig. 1 (*a*). If a milliammeter is used, an extra resistance of a few thousand ohms must be connected in series, as shown in Fig. 1 (*b*) to limit the current to a safe value. In the case of very high resistances, such as grid leaks, the current may be too small to be indicated at all, even though the circuit is continuous, and this particular test fails.

Condensers may be tested in a similar way, but as a good condenser has no conducting circuit through it, the conditions are reversed, and zero reading on the instrument scale shows that there is no short circuit in the condenser, and that the insulation between the plates may be satisfactory. But this test gives no proof that one set of plates may not be entirely disconnected from its corresponding terminal. With large capacity condensers, however, such as those employed for smoothing and decoupling, there is a very simple method of finding out if the internal connections are in order. On first closing the circuit there should be a preliminary deflection or kick of the meter needle due to the momentary charging current. If a continuous deflection remains after the initial kick, either the insulation is faulty or there is an internal short circuit. As before, a voltmeter should be used if possible or a milliammeter, safeguarded by a protective series resistance, could be employed.

Variable air condensers can be tested for internal short circuit in the same way; the rotor should be turned through the full range whilst the meter pointer is watched. Any sudden deflection shows that the rotor blades are touching those of the stator, or a particle of metal dust may be lodged between them.

To test the insulation between the primary and secondary windings of a transformer, or between each winding and the core, the procedure is the same as for a condenser.

Measurement of Resistance

The direct measurement of the value of a resistance is not quite so simple and straightforward as Ohm's law would appear to indicate, but as it is of such great advantage to be able to measure a doubtful resistance at times, an example of simple measurement is given here with explanations of the special precautions to be taken.

Ohm's law tells us that the current passed by a resistance is equal to the applied voltage divided by the resistance in ohms. The voltage is the driving force or electrical pressure, and the current is the resulting flow of electrons. If a resistance of R ohms is connected across a battery whose terminal voltage is E, the current flowing will be E/R amperes. But if a milliammeter is included in series with the resistance, as in Fig. 2 (*a*), to measure the current, the latter will be less than E/R amperes, because *the milliammeter itself possesses resistance*. If x is the resistance of the milliammeter in ohms, the total resistance across the battery is $R+x$ ohms, and it is this value which is given by the ratio of volts to amperes. Obviously, then, the milliammeter resistance must be known before a test of this nature can be made, unless, of course, the milliammeter resistance is negligibly small compared with the resistance to be measured, in which case it can be ignored. It is not a very simple matter to determine the resistance of the milliammeter if no other instruments are available, but very often the resistance is given by the makers or would be furnished on request.

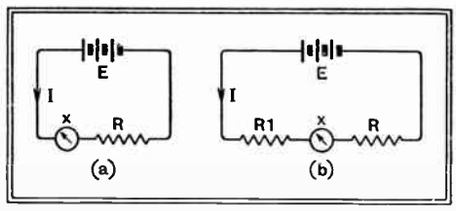

Fig. 2.—Measurement of resistance with a milliammeter and a battery of known voltage E. The circuit is shown at (a). The resistance of the milliammeter x must be allowed for. To guard against a possible short circuit in the resistance R a safety resistance R1 should be inserted temporarily as shown at (b) and explained in the text.

With the aid of a battery of known voltage and a milliammeter of known resistance, it is possible to check resistances over quite a wide range of values. A single accumulator cell gives very nearly 2 volts (except immediately after charging), and so, if an accumulator of several cells is available, several testing voltages are ready to hand. Suppose that one has a milliammeter reading up to a maximum of 24 milliamperes, and that its resistance is 15 ohms, and suppose, further, that it is desired to check a resistance rated at 250 ohms. A convenient current for measurement would be of the order of 20 milliamperes, or 0.02 ampere, and the voltage necessary to drive this current through 250 ohms would be, by Ohm's law, $0.02 \times 250 = 5$ volts. So one would use a 4-volt accumulator in the circuit of Fig. 2 (*a*). Suppose that the current is found to be 14.5 milliamperes with 4 volts applied; then the total resistance is $4 \div 0.0145 = 276$ ohms. Deducting the 15 ohms resistance of the meter gives 261 ohms for the component under test.

A Wise Precaution

It should always be remembered that a milliammeter is a vulnerable instrument and very easily damaged by an excess of current. Consequently, every precaution must be taken to prevent an accidental jar. If, for instance, the resistance R of Fig. 2 (*a*) happened to be short-circuited, the milliammeter would be ruined. A safety resistance R1 of the same order of magnitude as R could be included temporarily as at (*b*) in Fig. 2. If the current rises considerably when the terminals of R are bridged over with a piece of wire, all is in order, and the safety resistance may be taken out of circuit prior to making the actual measurement.

* * *

In a second part of this article an account will be given of simple tests and measurements which can be made on a completed receiver, and how a meter can be used to give a visual indication of the performance of a receiver.

NEWS of the WEEK

Current Events in Brief Review

All Eyes on Glasgow

GLASGOW, where the Scottish Radio Exhibition opens to-morrow in the Kelvin Hall, has been a stronghold of wireless since the days when 5SC (of blessed memory!) first transmitted the voice of the then British Broadcasting Company.

Of recent shows in Glasgow the most notable was that held last year in the same hall under the auspices of the *Glasgow Weekly Herald*. This year's Show—the first to be sponsored by the Radio Manufacturers' Association—will be a close replica, if on a smaller scale, of the Olympia Exhibition. With nearly eighty stands and a radio ballroom, the Glasgow Show bids fair to make new records both in attendance and business transacted.

A complete guide, with plan, appears on page 202.

The Prince of Wales

ROYAL recognition of wireless has been very marked in recent years, and the Prince of Wales will be carrying on the tradition when he honours the Radio Manufacturers' Association by attending the Annual Dinner in November under the chairmanship of Mr. W. W. Burnham.

This will be the first time that His Royal Highness has been present at this annual dinner.

All in 135 Minutes

MR. J. HUNTER, of Blackheath, London, whose station G2ZQ is one of the best-known in Europe, has put up yet another amateur transmitting record. In two and a quarter hours on one evening recently, he communicated with amateurs in New Zealand, Palestine, Argentine, French North Africa, the United States and England using the 20-metre band.

Future of Radio Paris

AS a sequel to the purchase of Radio Paris by the State, members of the station staff have received formal notice that their engagements will expire without renewal from December 3rd next. It is expected, however, that the whole of the staff will be re-engaged.

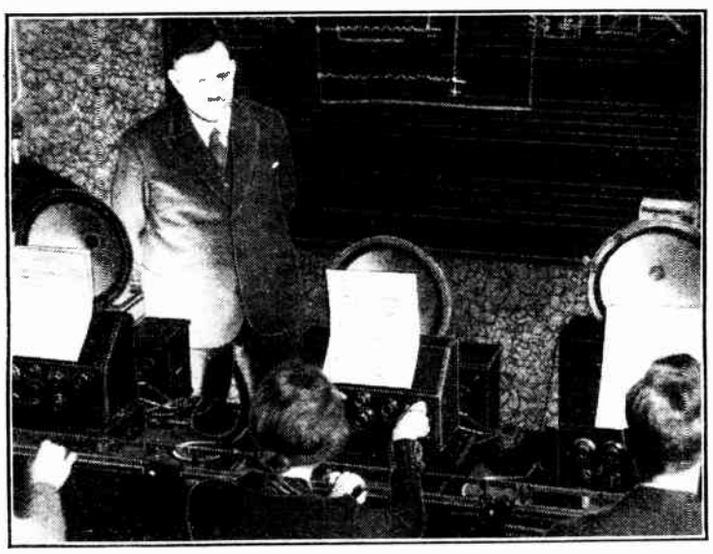
Luxembourg Stands Firm

RADIO LUXEMBOURG, it seems, intends to stand by its guns and continue transmissions on the 1,100-metre wavelength, despite the decrees of the International Broadcasting Union. According to a recent visitor, the management contend that it is impossible for an "international" station to work on an exclusive wave of 240 metres. It is hoped that this will be recognised at the forthcoming Amsterdam Conference of the Union.

The Luxembourg transmitter is open to inspection by visitors, who are enabled to see the studios through soundproof windows.

Programmes on Tap

THE peril attaching to the tapping of wires belonging to a wireless relay company was brought home to Mrs. Stanley, of Moorthorpe (Yorks.), when she was fined £1 last week for having fraudulently abstracted a quantity of electricity. Mr. E. H. Moorhouse, prosecuting on behalf of Economic Radio, Ltd., explained how, on July 21st, following much interference, it was found that Mrs. Stanley had tapped the wires and attached a loud speaker, with the result that some fifty or sixty subscribers on the far side of her house were cut off. The current consumed by Mrs. Stanley was only assessed at 1s., but the tracing and making good of the damage was 15s.



ELECTRICAL MUSIC. So high an authority as the Berlin State Academy of Music has now recognised the possibilities of the thermionic valve as a musical instrument. The photograph shows a Trautonium class under the direction of the inventor, Dr. Trautwein.

Kettering Radio Show

THE first annual radio exhibition at Kettering is to be held on September 14th, 15th and 16th in the Co-operative Central Hall under the auspices of the Kettering Radio and Physical Society.

Musical Murder

INVESTIGATION into a recent Paris murder revealed that a loud speaker was switched on in the flat in which the two victims, a mother and her son, were put to death. French detectives consider that the murderer had tuned in before making his attack in order to stifle any compromising sounds.

Lectures on Wireless

A COURSE of twelve lectures on "Wireless Science" are to be given at Morley College, 61, Westminster Bridge Road, London, S.E.1, by Mr. H. S. Ryland. The lectures will be given on Friday evenings at 7.30, beginning on September 22nd. Full particulars regarding fees may be obtained on application to the Secretary.

French Radio Revelations?

IMPORTANT revelations concerning the immediate future of French broadcasting and the development of the high-power scheme are expected when M. Laurent-Eynac, the Postmaster-General, speaks at the Paris Wireless Show Banquet. The Show, which is international in scope, will be held in the Grand Palais, Paris, from September 6th to September 17th. In addition to exhibits by practically the entire French radio industry, the "Salon" will contain a special section devoted to anti-static devices, the use of wireless in aviation, marine and Colonial services, and practical demonstrations of the manufacture of gramophone records.

A wave of wireless enthusiasm seems to be sweeping France, due to the development of the Ferrié scheme and the realisation that the State is going ahead with the development of broadcasting.

Pitch Pine for Radio Masts

THE increasing use of wood in the construction of wireless masts has greatly encouraged the timber trade. "The Timber Trades Journal" refers, with gratification, to the new German wireless tower erected at Rothsurven, near Breslau, which is built entirely of wood and is claimed to be the tallest wooden structure in the world. Its height is 400ft.

It is stated that German engineers combed the world for the best structural material available, and ultimately chose pitch pine, which is said to excel all other woods in homogeneous strength properties, and provides large dimensions relatively free from knots and defects. Its high content of resin acts as a natural preservative; in addition, pitch pine is not apt to check and split, and its shrinkage factor is very low.

THE BERLIN SHOW. Changed political conditions have made their impression on the famous German radio exhibition, which has just been held under the shadow of the Radio Tower, or Funkturm, in Berlin.

5-metre Tests in London

TRANSMISSIONS on 42.2 metres (7,097 k.c.) and 5 metres (5,600 k.c.) are being carried out to-day (Friday) and on Sunday next by Dr. C. G. Lemon (G2GL) at 72a, North End Road, W.14. The schedule is as follows:—*Friday*: 5 metres, 10.45 p.m. to 11 p.m.; 42.2 metres, 11 p.m. to 11.15 p.m. *Sunday*: 42.2 metres, 10.30 a.m. to 11 a.m., 11.30 a.m. to 12 noon; 5 metres, 11 a.m. to 11.30 a.m. Similar schedules will be followed throughout next week.

The Winning District

DISTRICT 15 of the Radio Society of Great Britain secured first place in the National Field Day organised recently by the Society, in which portable transmitters and receivers were operated by eighteen groups of amateurs from the R.S.G.B.'s nineteen administrative districts.

District 15 covers West London and Middlesex, and during the Field Day the call signs G6WN and G6YK were used, on the 160- and 80 metres, and on 40 and 20 metres bands respectively. A total of 364 points was obtained, with 64 contacts with other amateurs.

Dr. Koon Speaks

"EVEN the rubbing of a careless finger over a half-day's growth of beard may completely confuse a radio-audience," writes Dr. Cline M. Koon in his booklet, "The Art of Teaching by Radio," just published by the U.S. Office of Education. Dr. Koon advises the broadcaster to avoid heavy breathing, keeping time with his feet, clearing his throat or clicking his finger-nails. The announcer and operator, too, should play their part by making the speaker comfortable and at ease, allowing him to sit and roll up his shirt-sleeves.

It is very important that the broadcaster should assume a friendly, respectful attitude.

Practical HINTS and TIPS

IT is not difficult to see that the continuity and general condition of an earth connection cannot be checked by the methods ordinarily adopted in testing other circuits. A fairly good indication that something is wrong is often afforded by the fact that a general decline in signal strength is accompanied by a change in tuning, more capacity being needed to bring the aerial circuit into resonance with a given wavelength. But this latter effect is likely to pass unnoticed in a modern gang-tuned receiver.

Testing the "Earth"

To ascertain definitely whether the earth lead is broken, it is usual to make a test for continuity between the normal earth connection and a second extemporised "earth"; if all is well there should be negligible resistance between these two points. But the converse does not of necessity hold true; possibly the temporary and unknown "test earth" may itself be of high resistance.

A reader, who evidently believes in taking no unnecessary chances, describes a method of testing the earth connection for which he has made provision in his own installation. The details will be obvious from a consideration of Fig. 1, from which it will be seen that, in addition to the usual connection to the buried earth plate, a second lead, solely for testing purposes, has been soldered to it. The end of this lead, when not in use, is coiled up and concealed in a tin buried just below the surface of the ground.

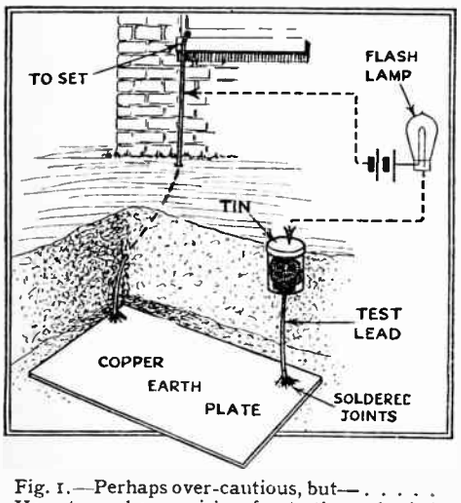


Fig. 1.—Perhaps over-cautious, but—..... How to make provision for testing a buried earth connection.

Although it must be admitted that precautions of this nature are hardly necessary in most cases, the provision of a testing lead in this manner involves very little extra trouble, and may save a lot of unnecessary work in the future, especially if the earth plate be deeply buried.

AIDS TO BETTER RECEPTION

ALTHOUGH modern D.C. valves work at a higher voltage and a considerably lower current than their prototypes, it is generally necessary to dissipate a considerable wattage in the main voltage-absorbing resistance, which is wired in series with the heaters. This energy is, of course, finally dissipated in the form of heat, and so an appreciable temperature rise may be expected.

D.C. Set Precautions

Instances have recently come to light where heat generated in this way has adversely affected paper-dielectric by-pass or smoothing condensers by melting the sealing compounds generally used in the manufacture of these components. It is accordingly wise to make sure that the condensers are mounted in a cool position, and certainly not in the immediate vicinity of the main resistance. In any case, provision for ventilation of the complete set should be made.

IT was recently pointed out that many liberties may be taken with regard to the layout of the L.F. section of a receiver. Unlike the H.F. amplifier, it is but seldom that the result of doing so will be to cause instability or some other manifestation of undesirable interaction. But, in view of the fact that the L.F. amplifier and power supply equipment are often designed nowadays as a single self-contained unit, it is perhaps as well to point out that a common—perhaps the most common—cause of mains hum is interaction between power and L.F. transformers. Fortunately it is seldom difficult to overcome this trouble by an experimental alteration in the relative positions of these components.

Transformer Interaction

IT is rather a pity that we are all prone to expect rather too much from new developments. Take Class "B" amplification; it is proving a real boon to those who are forced to use batteries for H.T. supply, but for mains use in ordinary sets it presents special problems, and, generally speaking, has few attractions. In spite of this there seems to be a tendency, among those who have mains available, to swing over to the new system.

For Batteries Only

In doing this they are certainly making a mistake; the older and more conventional circuits, with mains-driven valves and a liberal supply of anode current, may be expected to yield better results, and to involve fewer complications and less cost.

IN a recently published reply to a reader's query, it was pointed out that the system of automatic volume control employed in the original A.C. Monodial is impracticable for the D.C. version of the same set, due to the fact that no surplus H.T. voltage is available for the A.V.C. valve.

A.V.C. for the D.C. Monodial

It will be clear, however, that this objection does not apply when a user of the D.C. set is willing to employ an H.T. battery for the controlling valve. Although there may be a natural reluctance to use batteries in an otherwise "all mains" set, the plan is nevertheless quite a practical one, and the extra valve may be wired as shown in Fig. 2.

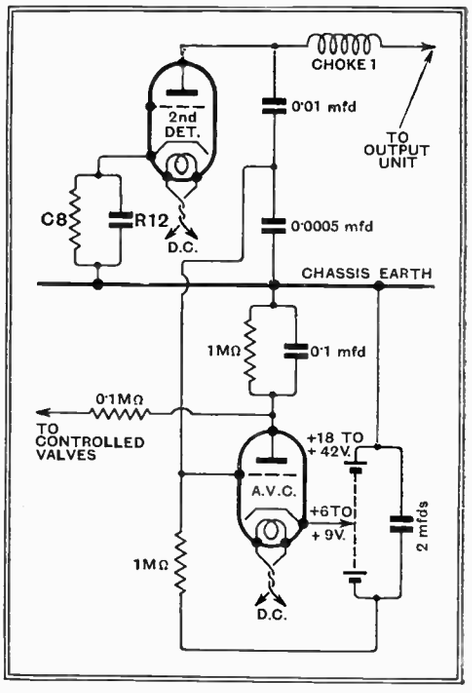

Fig. 2.—The addition of an A.V.C. valve to the D.C. Monodial.

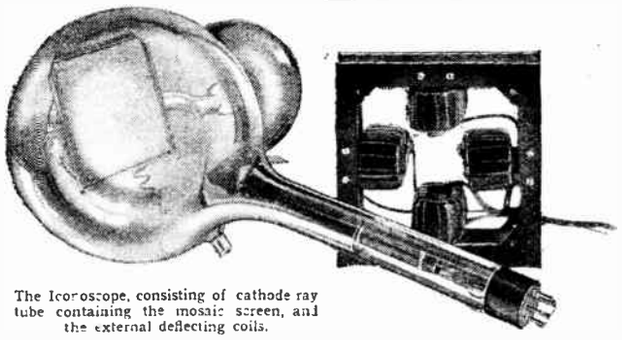
It is opportune to point out that, although a relatively high anode voltage is needed for the A.V.C. valve when full control has to be maintained in the neighbourhood of a powerful station, no such necessity arises in "wirelessly" remote localities where overwhelmingly strong signals are not to be expected. Where the input from the aerial cannot reach a high value, quite a small anode voltage suffices, and, according to a user of this system, a measure of control is still obtainable if the H.T. voltage be reduced to as little as 18 volts. The extent of delay in the action of the A.V.C. system is easily controlled by varying the cathode tapping on the H.T. battery; this determines, of course, the working bias of the grid. Incidentally, a Marconi or Osram D.H. valve has been found suitable for A.V.C.

The ICONOSCOPE



The Iconoscope, consisting of cathode ray tube containing the mosaic screen, and the external deflecting coils.

America's Latest Television Favourite

AN interesting step towards practical television was announced at a recent convention held in Chicago by the Institute of Radio Engineers; the "Iconoscope" of Vladimir Zworykin relating to the use of a cathode ray tube in place of a scanning disc. The Iconoscope is claimed to be several thousand times as efficient as the scanning disc even when it is working far below its theoretical maximum efficiency. It makes it possible to transmit twenty pictures, or more, per second, with a detail corresponding to as many as 250 lines per square inch. The most important feature of the device, however, is its power of imitating the human eye in regarding a picture continuously and in possessing a certain degree of retentivity. It replaces mechanical scanning and several stages of amplification; it is entirely electrical and has no moving parts.

The Iconoscope consists of two devices —a photoelectric mosaic on which the picture is focused by a lens system, and a cathode ray gun which fires at this screen a stream of electron projectiles. The elements of the device are shown in the drawing of Fig. 1. The signal plate upon which the picture is focused may be about 4×5 inches in dimensions and on its surface are millions of small photocells, each consisting of a minute silver globule sensitised by caesium. These minute photocells like a mosaic are deposited on an insulating plate, such as a thin sheet of mica, and the back of this plate is made conductive by a metal coating. Since both the photocell and the metal coating are conductors, and they are insulated from one another by mica, each individual photocell forms a small condenser with the metal plate. This capacity amounts to several hundred micro-microfarads per square centimetre, and the sensitivity of the photocells is equal to that of the modern caesium oxide type cells.

How the Image is Translated

Now, suppose a scene, say, of a well-lighted outdoor landscape is focused upon this plate. Since there are varying degrees of light and shade, there are varying currents flowing from the individual photocells. These currents charge the condensers associated with the photocells according to the flow of current, and the picture is thus translated into an electrostatic screen made up of many thousand electrical charges, each condenser being charged according to the intensity of the light falling upon its photocell.

Within the same glass bulb as the mosaic is the electron gun which throws a beam of electrons at this screen and which is made to sweep across the screen horizontally and vertically by means of deflecting coils, as in an ordinary cathode ray tube. Whenever an electron hits a photocell it neutralises part of the charge on the associated condenser. This discharge current is picked up, amplified, and transmitted to the receiving cathode ray beam which is moving across a fluorescent screen in synchronism with the scanning beam. The varying discharge currents modulate this receiving beam and hence the screen at the receiver.

Increase in Light Values

The Iconoscope apparently solves one of the worst problems of television, that of getting sufficient light from each point so that the resulting photocurrent can be effectively amplified for use at the receiver. In his description Dr. Zworykin states that a desirable picture would involve some 70,000 picture elements. If there are twenty pictures per second, the time of transmission of each element would be $1/1{,}400{,}000$ of a second. This is unimportant provided that the light intensity is sufficient to actuate the photocell in this small time. This is where the difficulty lies, however, for the photocell delivers a current depending upon the product of the light intensity and the time during which this light acts. If the time be decreased, the current is reduced. With a scanning disc the current falls as the square of the number of picture elements because the time decreases for any increase in the number of holes. It has been virtually impossible, therefore, to televise outdoor scenes because of the difficulty of getting enough light.

Again following Dr. Zworykin's reasoning, suppose it be desired to televise this outdoor scene. A camera with a lens working at a speed of F 4.5 would focus on a plate about $1/10$ lumen. Now, if a scanning disc were used to take this picture apart and transmit it into a photocell of average sensitivity, say, 10 microamperes per lumen, a single picture element would produce a current of the order of 1.43×10^{-11} ampere. In the time available this would produce a charge of 1×10^{-17} coulomb, corresponding to about 63 electrons. All this means that tremendous amplification is necessary if an outdoor scene is to be transmitted successfully.

The trouble with the scanning disc system of taking the picture apart is that the light from a single point of the scene affects the photocell for such a short space of time. If the photocell could see all of the picture all of the time, as is true of the human eye, the efficiency or light gathering power compared to that of a disc scanner would increase as the number of picture elements. Thus with 70,000 elements the Iconoscope, which accomplishes this seeing-all-at-once, is theoretically 70,000 times as efficient as the scanning disc and hence the amplification may be reduced to a vast degree. Actually the efficiency of the Zworykin device does not reach this figure, but it is stated to be several thousand times as good as the scanning disc.

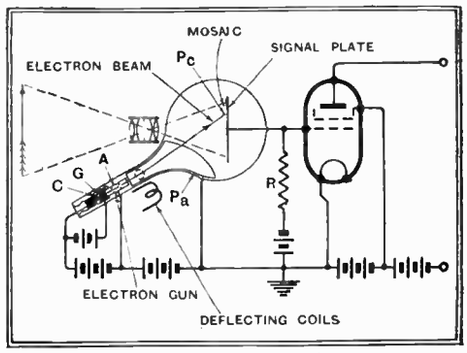


Fig. 1.—Elements of the Iconoscope device.

The mosaic of photocells has the entire picture focused upon it, resulting in the continuous emission of electrons according to the degree of light and shade in the picture. Once in each repetition of the picture the charge on the condenser acquired by each element of the mosaic is released by the cathode ray beam.

The fact that the transmitting screen is 4×5 inches in size is no indication that the receiving screen is limited to this size. In fact, Zworykin claims methods of projecting the picture from the fluorescent end of the cathode ray tube upon a larger external screen by lenses and mirrors.

Dr. Zworykin's paper, when available for publication, will contain many most interesting facts with reference to the composition of the mosaic, the size of the cathode ray beam when it hits the screen, the detail secured, etc. In the opinion of well-known American engineers it marks another landmark in the history of television.

New Class "B" Output Valve

Operating Data and Curves for the Marconi and Osram B.21

FROM the point of view of the battery user, Class "B" amplification is one of the most important of recent developments, and it is interesting to see that the Marconiphone and Osram G.E.C. Class "B" valve departs from normal practice in several particulars. The valve consists of the usual two triodes in a single glass envelope, but these triodes have comparatively low amplification factors. At zero grid bias, therefore, the anode current is quite high, and the anode current cut-off point is not reached until some 4 to 6 volts negative bias is applied to the grids. The valve, therefore, is normally biased by this amount, and this leads to several important points.

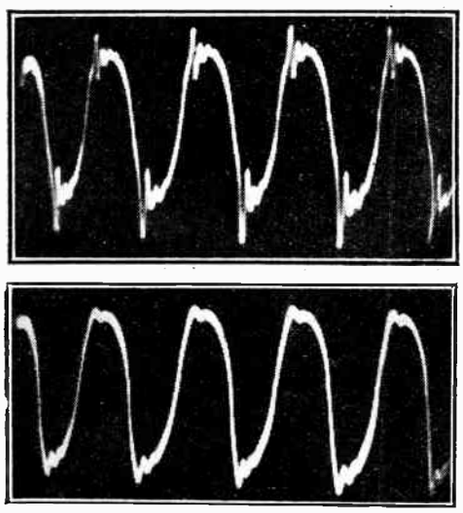

Fig. 1.—The upper oscillogram shows the output of a zero-bias Class "B" valve, and the lower that of the B.21.

First, grid current does not flow for a small signal input, with the result that the input impedance is high, and the system is more like a triode Q.P.P. arrangement than true Class "B." Secondly, with a large input grid current does not flow throughout the whole cycle of the input voltage, but only during a portion of it. The input impedance, therefore, is much higher than that of the zero-bias type of valve, and less power is required to operate it.

One important result of this lies in the possibility of reducing the ratio of the driver transformer, in some cases to a 1:1 ratio. Under certain conditions, moreover, it even becomes practicable to employ a step-up ratio. There is, therefore, an appreciable gain in amplification and a smaller signal input is necessary at the grid of the driver for full output.

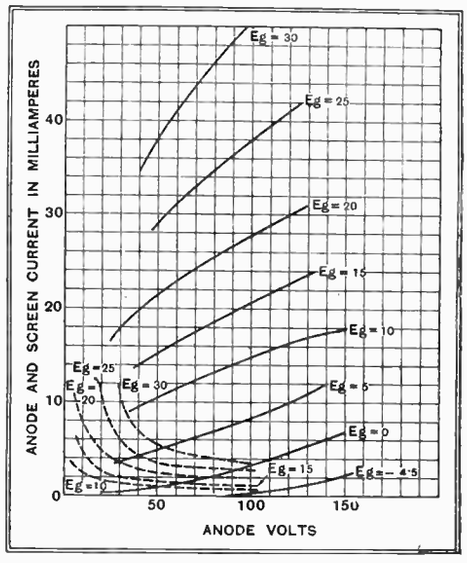

Fig. 2.—Anode volts-anode current curves of the B.21.

Of even more importance, however, is the reduction in the tendency towards the generation of parasitic oscillations. These are often found in the circuit comprising the leakage inductance of the transformer and the stray capacities, and occur in that valve circuit which is for the moment idle. Due to the lower amplification factor of the B.21 there is not this same tendency towards parasitic oscillation, and the makers claim that it is consequently easier to obtain good quality reproduction. The point is well brought out by the oscillograms of Fig. 1, which are both taken for an output of 250 milliwatts. The upper photo shows the waveform of the output of a zero-bias type Class "B" valve when fed with a sine wave input. It will be seen that a fairly strong high-frequency oscillation is superimposed on the main output. The lower oscillogram refers to the B.21 valve, and it will be obvious that, although there is still a high-frequency oscillation present, it is much smaller in amplitude, and the reproduction obtainable is correspondingly improved.

Operating Conditions

Three alternative operating conditions are recommended by the makers. The first is for maximum economy, and with 120 volts anode supply a bias of 4½ volts is needed. The load impedance must be 18,000 ohms, and the driver transformer can have a step-down ratio of 1.5:1 from the L.21 driver valve. The standing anode current of the output valve is then 1.7 mA. and the output is 750 milliwatts.

The moderate economy condition leads to an output of 800 milliwatts for the same anode voltage, and the bias can be only 3 volts. The load now becomes 12,000 ohms and the driver transformer can be between 1.5:1 step-down and 1:1 ratio.

The condition for maximum output, however, necessitates an L.P.2 driver and an 8,000 ohm load on the Class "B" valve, the standing anode current of which increases to 3.5 mA. The output is 1,200 milliwatts with a 120 volts H.T. supply, and 2,000 milliwatts with 150 volts. In this latter case 4½ volts bias is needed, and the standing current becomes 4 mA.

Considerable latitude in the operating conditions is thus permissible. As is usual in Class "B" working, it is advisable to connect a 0.005 mfd. condenser across each half of the output transformer primary. When using the lower values of load impedance a somewhat higher capacity is better.

Fig. 2 shows the characteristics of the valve, and Fig. 3 the grid current curves.

Constructionally, the bulb of the valve is unusually shaped, and the upper narrow portion grips a mica bridge holding the electrode assembly, and so increases the rigidity. Instead of a single fine grid for each triode, two rather coarse-mesh concentric grids are used, thus giving an unusually robust construction. It is, of course, fitted to the standard 7-pin base.

To sum up, it will thus be seen that the valve differs radically from other types, and, although it consists actually of two valves in a single glass envelope, its filaments consume no more than 0.2 ampere at 2 volts. The input impedance is high, some 36,000 ohms, resulting in a reduced tendency towards parasitic oscillation, and the valve needs negative grid bias.

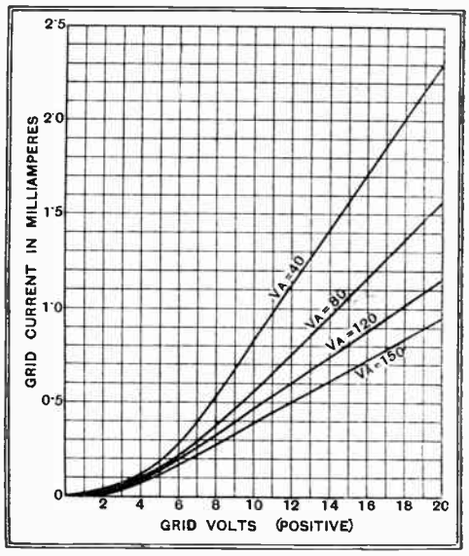

Fig. 3.—Grid volts-grid current curves of the B.21.

New Catalogues Received

Wright & Weaire, Ltd., 740, High Road, Tottenham, London, N.17.—25-page booklet describing "Wearite" components well illustrated and containing many useful theoretical diagrams and explanatory drawings of coil assemblies. The price is 3d.

A. F. Bulgin & Co., Ltd., Abbey Road, Barking.—Of the 80 pages contained in this well-illustrated and informative catalogue 25 are devoted to a Technical Manual dealing with the many applications of Bulgin components.

F. C. Heayberd & Co., 10, Finsbury Street, London, E.C.2.—1934 catalogue of Radio Mains Equipment; a 36-page booklet dealing with H.T. units, battery chargers and mains transformers. Twelve pages are devoted to eliminator kits, a theoretical circuit diagram being given for each model. The price is 3d. post free.

Binaural Reception

An Acoustic Illusion Telephonically Achieved

By HARVEY FLETCHER

Acoustical Research Director
Bell Telephone Laboratories

ABILITY to locate sounds is mainly due to interaction between the two ears. Stopping up one ear renders location of sounds almost impossible. Interesting experiments with telephone links to demonstrate this facility are described in this article.

DURING the winter and spring of last year a strange figure inhabited the American Academy of Music in Philadelphia. Looking him full in the face, one met unblinking eyes and a slight smile, fixed and unfading; and this evidence of inhumanity was confirmed by looking at him in profile, for just in front of his ears microphones were set into his cheekbones. Thus Oscar, a tailor's dummy, though less than human in appearance, was given one capacity that was more than human; that of instantly communicating to others exactly what he heard, exactly as he heard it. To listen through the receivers connected to Oscar's microphones was to put oneself in Oscar's place. This capacity of Oscar's gave him an important position in the tests of musical reproduction conducted by the Bell Laboratories in co-operation with Dr. Leopold Stokowski and the Philadelphia Symphony Orchestra.

Locating Sounds

When one hears a sound one can usually locate approximately its point of origin—its distance and direction. The mechanism by which this location is accomplished is not altogether understood, but the interaction of the two ears seems to have much to do with it, for stopping up one ear destroys the ability almost completely. In listening to an orchestra under the two conditions the difference in effect is quite similar to that between a view seen in full perspective with both eyes and in flat panorama with only one.

It is to be expected that any two sound-apprehending devices could double for the ears. Two microphones, placed the same distance apart as human ears, could be independently connected by two receivers. A person putting the receivers to his two ears would be acoustically transported to the location of the microphones no matter at what distance from them he might actually be, hearing all sounds as he would if his ears were in the positions of the microphones. Oscar duplicates the conditions of normal hearing as nearly as possible, not only by supporting the microphones the proper distance apart, but by modifying the sound field near them as a human head modifies it near the ears.

In the extent to which they approach the conditions of normal hearing, systems for transmitting sound can be roughly divided into four classes, as represented in Fig. 1. In "monaural" systems, such as the commercial telephone, a single transmitter is connected to a single receiver. "Diotic" systems, in which the transmitter is connected to two receivers, one for each ear, are familiar to those who have used double head telephone receivers. "Mixed" reception is found in the similar use of double receivers to monitor a loud-speaking public address

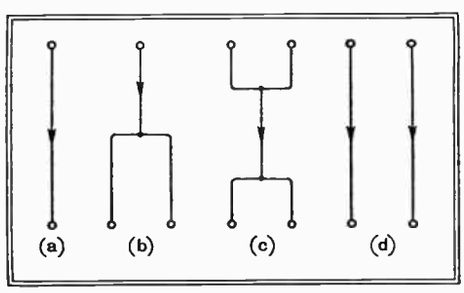

Fig. 1.—Systems of transmission can be roughly divided into four classes: monaural (a), diotic (b), mixed (c), and binaural (d).

system, in which two microphones are used to pick up the programme and their outputs are mixed. Of "binaural" systems, in which the outputs of two microphones are separately conducted to the two receivers, only a few experimental examples have been built.

From the familiar monaural condition the change to the diotic produces mainly the effect of an increase in the loudness and fullness of the sound, and of a shift of its apparent source to the centre of head. Changing to the mixed condition adds a roughness to the sound, but leaves its loudness and apparent source as they were when reception was diotic. With the final change to the binaural condition the apparent sources of sound move to approximately their proper locations in space, and the apparent reverberation is greatly reduced.

Importance of Frequency Response

To provide for the experiments in Philadelphia, a binaural system which would reproduce speech and music faithfully in all respects, microphones, amplifiers and receivers of the highest quality were used in the two channels, transmitting extremely wide ranges of frequency and volume. Since the response of a receiver depends upon the person's ear upon which it is placed, perfect reproduction requires a different equalisation for each person. In these experiments, however, only a single equaliser was used, which was an average for a group of listeners. By its use the frequency characteristics of the system were corrected, so that all observers agreed that the reproduction was exceptionally faithful.

Striking evidence of the naturalness which can be secured with such a binaural system was obtained at several formal demonstrations in Philadelphia. When the guests had put to their ears the receivers connected to Oscar, who was in another room, someone would say confidentially in Oscar's ear, "Please move over." A surprisingly large number of the guests would start to obey the command before realising that it came from

Binaural Reception—

the receivers. Afterwards someone would whisper in first one and then the other of Oscar's ears, and would tear paper, jingle keys or thump a tambourine to illustrate the fidelity of the system to sounds of high frequency. Finally Oscar would be brought out and set in the midst of the audience, so that they could compare for themselves the direct with the transmitted sounds.

Experiments showed that the advantage of using Oscar, instead of two microphones less dramatically mounted, was confined to cases in which the sounds originated quite near the microphones. For tests of the reproduction of music, therefore, two microphones were hung from a bar. It was found that, when the localisation effect of the system is disregarded, the best place for the microphones is relatively near the orchestra, where the tones are brilliant because absorption has not diminished the high frequency components as it has by the time the sounds reach remote parts of the hall. The localisation is such, however, that observers sitting at the rear of the hall, where they can see the orchestra, prefer to have the microphones near them, even at the expense of tonal brilliance, for otherwise they find themselves discomforted by being acoustically in one place and visually in another. This effect has even been noticed by observers in another room, where a screen placed the source of sound at a certain apparent visual distance.

In comparisons of binaural with loud speaker reproduction, even the inconvenience of wearing head receivers does not prevent most observers from preferring the binaural system. In an attempt to rate the worth of the binaural system, observers were asked to note their preference between monaural reproduction of the full frequency range and binaural reproduction of various limited frequency ranges. Even when all frequencies over about 2,800 cycles per second were suppressed in the binaural system more than a third of the observers preferred it.

To give a wider public the unique experience of being put in the other man's place by a trick of the ear, a binaural system has been set up. In this Oscar II will appear in a glass booth somewhat similar to that shown in the title picture, and observers who hold to their ears a pair of telephone receivers will feel as if transported to Oscar's position, there to be addressed by his companion. The system will furnish to those who use it dramatic proof that there is no longer any limitation, except expense, to the acoustic fidelity which electrical transmission systems can achieve.

Thoughts on Olympia

By a Critic of Quality

In the Following Article a Wireless Engineer Gives His Personal Impressions of the Show

I SET out to examine the exhibits at the Radio Show from a viewpoint differing from that of the official *Wireless World* reporters, because I am not so concerned with giving a complete description of the various manufacturers' achievements as in indicating what I think are desirable or undesirable trends of development.

I am one of those who have always held very strong views on the necessity of preserving the true function of radio apparatus, namely, to give in the homes of subscribers to the broadcasting service a true and faithful reproduction of what that service offers. This being so it is natural that I should examine the show to see what progress has been made in this direction.

Most manufacturers are of the opinion that the largest amount of money is to be made by selling the largest possible number of sets. Past experience shows this opinion to be a sound one, but, as the largest sales are made by the cheapest articles, it follows that cheapness calls for the sacrifice of excellence, so that we have a state of affairs in which the receiver most suited to the needs of the listener is generally much too expensive for him. The portable set craze of a few years ago was the start of the trouble. At that time sets were not very good no matter what the price paid, but some mis-inspired genius conceived the idea of making still worse sets, but appealed to the public to appreciate the convenience of portable radio. Tens of thousands of these sets were sold, and I am convinced that 99.9 per cent. of them were never shifted out of the room in which they were first placed; we have the result that performance was spoiled to secure a property that the public did not require or appreciate, and, at the same time, the public taste was so spoiled that a demand for good sets has not yet made itself evident. It is notorious that the general mass of people does not know what it does want, and the manufacturers, assuming that what is thought is wanted is a large number of foreign stations, continue to offer sets in which quality of reproduction is subservient to the demand for the reception of distant stations. In the course of my everyday life I come across a very large number of listeners of all classes, and I know of only two people who neglect the reception of B.B.C. programmes entirely for foreign stations; it so happens that both these people are completely devoid of any sort of musical or educational appreciation. Many people wish from time to time, to tune in distant stations for the sake of special programme items, but, with several foreign stations at their present quality and power, quality of reproduction is just as important as when receiving the local B.B.C. transmissions. Radio can give exceedingly good and natural entertainment, but the time must surely come when the public will wake up to the possibilities of the science and then, perhaps, we will have some technical progress in the direction of quality of reproduction.

Quality Should Come First

As much money should be devoted to quality as is now spent on increasing selectivity and sensitivity to make reproduction from a local station really worth listening to, for the cheap set sounds very bad on a good transmission. The consequence of selling large numbers of sets giving distorted reproduction is to drive still more firmly into the public mind the idea that the sounds produced are the kind of sounds that radio is expected to produce. Were this truly the case, there would be every justification for the B.B.C. to spoil the quality of its transmissions to an extent where it would be equal to that of the average commercial set; if such did happen it would be found that the final results were so bad that the radio industry would die out. In case anyone takes exception to this statement, I would like to point out that I did not meet with a single radio-gramophone at the show which was capable of getting the best out of a good gramophone record;

WIRELESS AND THE POLICE. Few police organisations dare forgo the benefits of radio. Here is a scene in the radio receiving room at police headquarters, Rio de Janeiro, which has just been equipped with a Marconi installation.

Thoughts on Olympia –

to do this calls for an exceedingly good amplifier and loud speaker which will do useful work up to far more than 6,000 cycles, although it is a commonplace that records cut off below this figure; I mention the point to show a close connection between the comparative merits of a record going through a good L.F. apparatus, and a good B.B.C. transmission going through a poorly designed set. Present reproduction is obtained in spite of receivers and not owing to their inherent "excellence" of design. With one or two solitary pioneers excepted, we would be in a bad way indeed were it not for a responsible technical press.

The Superhet Stampede.

The superheterodyne principle of reception seems to have become the master rather than the servant of the manufacturer. It can fairly safely be assumed that this journal was responsible for the return of the superhet. to favour, but it does not follow that *The Wireless World* recommended that every manufacturer (with one or two notable exceptions) should go "super mad." This type of receiver is very suitable for the home constructor owing to the ease with which it can be made to work satisfactorily; on the other hand, for equal selectivity and sensitivity, the straight multi-stage set is a very troublesome beast for the amateur. It would seem to be equally troublesome to the professional, who has little excuse, with all his facilities, for rushing to the superheterodyne principle where the straight set, properly designed, would meet the case better.

It should be borne in mind that the manufacturer can and does purchase ready-made ganged coils and condensers for superhets., and almost any schoolboy could finish the design of the set. It takes real brains, however, to design a really good straight receiver, for the usual canned or iron cored coils are not by any means good enough, and possess certain disadvantages which preclude their use in a satisfactory design; the consequence is that the technician has to design "from the ground up," and that, I fancy, is a task beyond the capabilities of many in the industry.

I was interested to find several firms who were making a speciality of building a "limited number of high grade receivers for the connoisseur." In one or two cases there was evidence of real thought and research behind the receivers shown, but a word of warning might not be out of place to those manufacturers contemplating entering this field. In every ten or so listeners there is one man who wants something better than he can find in the ordinary way, and that man is going to choose his special set on performance and nothing else. The inclusion of a conventional set in an elaborate cabinet, and a multiplicity of valves does not make a "high grade set for the connoisseur" although the showy outside may appeal to the bloated plutocrat; most of the real searchers after something good whom I have met have usually been somewhat hard up, so everything should be devoted to the one purpose of giving superlative performance; one manufacturer told me he *started* with an "exquisite cabinet" and fitted the set in afterwards; the idea is, at any rate, original, but has little else to commend it.

Moving-coil speakers continue to get smaller and cheaper, and some people may say that putting this type of speaker within the reach of everybody is progress, but I must confess that I do not see how it can be. The function of a loud speaker is to translate into sound what is put into it electrically, and I did not find any manufacturer showing on his stand how this was done with less distortion than heretofore. If the midget set idea is responsible, then the midget set is a menace to the future of broadcasting.

The real novelty merchants this year were the valve makers, and some very interesting and amusing things can be done with the new types now available. The wholesale adoption of A.V.C. has, in most cases, only been made possible by the work done in valve laboratories, so we will give credit here in the proper place. In the space at my disposal I cannot say much about valves, but a point that is not sufficiently realised about Class B amplification is that it is only really useful on substantially constant modulation; the power provided is truly astonishing considering the size of the valves, but it should be remembered that this power is only undistorted when the output stage is going "all out" with the circuit arrangements usually given: most Class B output stages require positive bias. The constantly varying modulation of transmissions carrying music means that, for most of the time, the power stage is under-run and a particularly unpleasant form of distortion is set up which can be very irritating to sensitive ears. Do not, therefore, design your new A.C. set and expect to get from two 5-watt what you would obtain from two 25-watt valves.

Components generally showed a great improvement, both in the elimination of unworthy designs and in the introduction of new features of great use to the home constructor. It can safely be said that component manufacturers are giving better value for money, but it is disappointing to find that the perfect volume control has not yet been invented.

I think the time has come to abolish the scheme of piping through fifth-rate gramophone records for the edification of the public through the medium of speakers on exhibitors' stands. This proves nothing to anyone beyond the fact that the B.B.C. is up against enormous difficulties in turning out presentable noises. I would imagine that actual demonstration on the stands would give the public an opportunity of hearing for themselves the difference between the various sets offered; if exhibitors were rigidly tied down to receiving and reproducing only, say, the Regional programme, at not more than 5 watts output, we would soon be able to separate the grain from the chaff. Were such an obviously sensible arrangement put into force, I can well imagine the howls of protest that would go up from the less capable manufacturers, but it would be a good thing for technique, and that is all that concerns me.

A bright show, a pretty show and, in all probability, a selling show, but rather a disappointment for the student of quality reception. I think I will leave it at that.

CAR RADIO: MILITARY VERSION. A typical scene during the recent manœuvres in Hampshire, showing a wireless car in action.

The Radio Industry

AMONG the latest productions of the Ever Ready Co. are two special H.T. batteries for sets including Class "B" amplification. Type No. W.1210 is rated at 135 volts plus 18 volts for grid bias purposes, and tappings are arranged in accordance with suggestions recently put forward in *The Wireless World*.

Mr. T. W. Small, inventor of the well-known "Capehart" record changer, is now in London, staying at the Carlton Hotel. He would welcome a visit from British manufacturers who might be interested in the production of his new fully automatic record changer, operating without the use of gears, chains or sprockets.

GLASGOW SHOW PLAN

Guide to the Stands at the Kelvin Hall

September 1st to September 9th

IN last week's issue, the third of our special Olympia Show numbers, we dealt in some detail with the exhibits of interest on the stands of every manufacturer. Now the Show moves on to Glasgow, and to-day, September 1st, the Scottish Radio Exhibition opens at Kelvin Hall, closing on September 9th.

Nearly all the standholders at the Kelvin Hall were also exhibitors at Olympia, so that our Olympia stand-to-stand report of last week may also be taken as a guide to the Scottish Exhibition, a plan of which is included on this page.

Full List of Exhibitors

Local addresses of firms are given in some instances

Exhibitor.	Stand.

Broadcast Brevities

By Our Special Correspondent

WHERE IS IT? The mystery building in West London which, according to our Special Correspondent, the B.B.C. hopes to transform into a "Music Hall" for vaudeville shows as well as choral and orchestral concerts.

A New "Music Hall"?

I AM able to reveal that the B.B.C. is conducting negotiations for acquiring an old skating rink in Maida Vale and transforming it into a dazzling "Music Hall." Here, in a vast and lofty building covering an area of 58,000 square feet, the Corporation will run a restaurant, green rooms for artistes, and several minor studios in addition to the large hall from which vaudeville and variety will be broadcast free from the restrictions attaching to Broadcasting House.

Secret Negotiations

Up to the moment of writing the utmost secrecy has been observed in connection with these arrangements, although it has long been apparent to informed onlookers that the B.B.C. was straining at the leash in regard to studio accommodation. The B.B.C. tenure of "No. 10," the famous wharf studio, is exceedingly precarious as the L.C.C. has the power to take over the building at very short notice, and may exercise its prerogative; yet the wharf is the B.B.C.'s only real large studio, apart from the Concert Hall at Broadcasting House, which is admittedly too small to accommodate the National Orchestra.

Space for 250 Singers

At Maida Vale it should be possible to rehearse the entire orchestra of 117 players as well as the National Chorus of 250 voices.

Until recently the hall was used as offices for the Ministry of Health.

The Big Three

THIS morning at 10 o'clock Colonel Dawnay enters upon his duties as Director of the B.B.C.'s Output Department. Structural alterations have already been effected at Broadcasting House to enable the new Director to keep in close touch with the Director-General and the Controller.

Sir John Reith for America

The party is likely to be broken up for a little while in the near future when Sir John Reith responds to the invitation of Mr. Aylesworth, President of the National Broadcasting Company of America, to attend the opening of "Radio City," the great new centre of entertainment between Fifth and Sixth Avenues, New York.

Strange . . .

Sir John will probably be included among the speakers, and as the ceremony will be broadcast and relayed across the Atlantic, British listeners will have one of those rare opportunities of hearing the "D.G." on the ether. Strange that Sir John should cross the Atlantic to speak to his own flock, but this is a strange world, as the boxer said when he "came to" in the television studio.

The Boxing Match

Which reminds me that the boxing match in Studio Bb last week made a good showing on the television screen although the figures were rather small.

Problem for Television Talkers

I learnt one thing on that occasion, namely, that the television talker requires a technique rather different from that of the ordinary broadcast speaker closeted in a talks studio. There is nothing more irritating than a close-up of an immovable face continuing for ten minutes!

How our profound but undemonstrative speakers will get over the difficulty I know not, but I am convinced that plastic features and sparkling eyes are a necessity.

Electric Piano Broadcast

IT was delightful to hear the Neo-Bechstein piano broadcast on Saturday last, and gratifying to reflect that the innovation was the outcome of a suggestion first made in these columns.

The instrument gives most puzzling effects. Sometimes one detects the authentic pianoforte tone but more often the impression is of an orchestral combination with organ background.

Bedtime Stories

FOR a long time there has been a bathroom in Broadcasting House. Now there is a bedroom, which has been placed at the disposal of Empire announcers for use between their spells of night duty.

I understand, however, that the occupants will not make their announcements from the bedside, although several of the tribe at Broadcasting House would be quite capable of announcing in their sleep. In fact, they often do.

Mr. Stanley Baldwin

TWELVE talks under the general title, "National Character," will be broadcast during the autumn. On September 25th, Mr. Stanley Baldwin, M.P., will introduce the series in a twenty-minutes' broadcast on the National wavelength.

The subject is one very much after Mr. Baldwin's heart; for the series will attempt to describe the salient features of the British character both in its strength and weakness. An interesting aspect of the series will be the introduction of a foreigner at the microphone, to tell listeners about various aspects of our national character as they appear to him.

Hitler Relay Declined by B.B.C.

THE publication in a B.B.C. journal of sympathetic remarks concerning the German broadcasting chiefs who have been sent to the Oranienberg Internment Camp, brought an unexpected offer from the Reichs Rundfunk Gesellschaft of a special relay from the Camp.

Apparently the intention was that British listeners should have an opportunity of hearing a first-hand account of the happy and orderly conditions obtaining in the Camp. The item was offered to the B.B.C. for Tuesday evening, August 22nd, but the B.B.C. declined the honour. It is significant that the relay, which would have been broadcast throughout Germany at the same time, was cancelled.

They Dreamt They Dwelt . . .

IT is scurvy treatment for the B.B.C. Publications Department to be harried from pillar to post, seeing that it is from the activities of this branch that the Corporation derives a goodly percentage of its income.

. . . in Marble Halls

Nevertheless, it is the Publications who have had to move into that old chateau, No. 10, Portland Place, which in the last week or two has been transformed into a modern office. It was the Publications Department which was farmed out in Southampton Street, Strand, in the old Savoy Hill days, so it is natural, I suppose, that they should be the first to leave the crowded pleasure dome in Portland Place.

Cause and Effect

A FRIEND of mine was not surprised to read last week of the decision to transfer "Nine Days' Wonder" from Olympia to the Palladium. He was attending the revue, and was actually seated near to Mr. George Black, of the General Theatres Corporation. Half-way through the show, when the audience was rocking with laughter, a loud voice was heard to say, "My word! This would make George Black sweat if he heard it!"

A few minutes later George Black was hurrying towards the stage door to interview Mr. Maschwitz, and the sequel was made public next morning.

Correspondence

The Editor does not hold himself responsible for the opinions of his correspondents.
Correspondence should be addressed to the Editor, "The Wireless World," Dorset House, Stamford Street, S.E.1, and must be accompanied by the writer's name and address.

Valves or Stages

WITH reference to the suggested new designation for receiving sets given in your issue for August 4th, we should like to express the opinion that the suggested idea of describing a set by its stages is likely to lead not only to a very great deal of confusion but also to open up the path for misrepresentation.

As an indication of the confusion that is likely to arise, it would appear to us that, working to the suggested definition given in your leader, the Ferranti "Gloria" Consolette, described on pages 78 and 79 of the same issue, is actually a seven-stage receiver and not a six-stage as described by you, seeing that in the second detector there are three anode-to-cathode electron streams.

When the Ferranti Company first placed its receivers on the market, it described its three-valve mains receiver plus a rectifier as a three-valve set, and, as the result of considerable experience, it was found that this led to endless confusion, bearing in mind that the people who buy sets in general know next to nothing about them.

Further, the standard practice in the case of American receivers, was to include the rectifier as a valve, and such competition has had to be met in a suitable way.

We have always made it very clear in our specification as to the purpose of each individual valve, but we think that it is utterly absurd for manufacturers to be placed in the position of having to tell the man in the street that certain of the valves in their receivers are valves, whilst the rectifying valve, which is probably more correctly a valve than any of the others, is not a valve.

It appears probable that to describe a set by the number of its valves or by the number of its stages is likely to be very misleading in any case, and does not, in these days, necessarily give any indication of the performance of the receiver, so for this reason Ferranti, Ltd., have this year gone still farther than any of the foregoing proposals, and do not in any of their descriptions call their sets by the number of valves that they contain, although this may be found from the technical data included in the literature concerning the sets in question.

FERRANTI, LTD.
J. BAGGS, Sales Department Publicity.

The Correct Application of A.V.C.

MAY I be permitted to express some views on the application of A.V.C. to receivers in this country in view of the recent correspondence on this subject?

Firstly, I am entirely in agreement with Mr. Redfern that A.V.C. is undoubtedly desirable in the serious listener's receiver, but only when that receiver has been designed as a whole to incorporate A.V.C. and to overcome its associated disadvantages (such as those enumerated in Mr. Haynes' letter). Apart from the valuable correction of fading, an inexperienced person can leave the volume control set and tune in station after station without getting on the nerves of other people present by making a series of blasts and over-loading the output valve. Perhaps I had better use the word "almost," because automatic *volume* control, *i.e.*, automatic levelling up of the volume delivered by the loud-speaker on all stations, will never be possible unless broadcasting stations come to some agreement as to the minimum and maximum modulation limits desirable. At present the difference in modulation levels is only too evident when operating an A.V.C. receiver with a milliameter in the anode circuit of one of the controlled valves. Actually, the function which we loosely call "A.V.C." is concerned only with the carrier amplitude and not the modulation depth, so that two stations whose field strengths are equal at the aerial may produce average volume levels at the loud speaker in the ratio of about 2 to 1. This is annoying, but cannot be helped. However, the manual volume control is a convenient compensator.

The strongest criticism against A.V.C. is the apparent loss of selectivity. When tuning from one to another of two adjacent stations with a good A.V.C. receiver the side bands are so enormously amplified by the A.V.C. action that there is no silent gap between the two stations. Because of this effect, A.V.C. is entirely unsuitable for inclusion in simple sets with few or flatly tuned circuits where the resonance curve of the tuned circuit does not fall away very steeply at the sides. Although this reduction of selectivity is stated to be apparent only, nevertheless the selectivity of the receiver as a whole is definitely reduced if it cannot, with A.V.C., receive as many stations free of interference as it can without.

The criticisms on the score of background mush have been adequately dealt with by Mr. Redfern, but it does not appear to be generally realised that, apart from quiet A.V.C., which is a luxury only likely to be found in highly priced instruments, it is quite a simple matter to suppress this interference as well as all other between-station noises.

If the receiver be fitted with a device giving visual indication when the set is in resonance with the wanted station, why then we can short out all the undesirable noises between stations with a silencing switch and tune in our station quietly and accurately, the switch being opened only when the station has been correctly tuned in; so that instead of the quality varying from a high-pitched cacophony gradually down to the natural tone, the natural tone is there immediately the station is heard. This meets most of the criticisms fired at A.V.C., and works delightfully in practice, particularly when signals can be faintly heard in the "silent" position, so that the operator can tell whether the programme is desirable before inflicting it on other listeners.

As regards atmospheric interference it is difficult to be certain whether or not A.V.C. is beneficial, and one must not make wild claims. It has been found possible, during the recent thundery conditions in London to receive the London Regional on an A.V.C. set with a 100-foot aerial with scarcely any interference, although distant stations were unintelligible through mush and crashes. This is due to the receiver being rendered so insensitive by the strong carrier of the local station that no appreciable amplification is given to the static picked up by the aerial.

There seems to be no justification in practice for contrasting the two systems of simple and delayed A.V.C., for when the former is correctly applied the "throttling effect" is quite negligible on a weak signal. It has been found possible to make a six-valve A.C. superhet. with loose H.F. and I.F. couplings for selectivity and a diode-tetrode for A.V.C. with no delay action, which has an absolute sensitivity of 2-5 microvolts over the tuning range, *i.e.*, to produce the standard output of 50 milliwatts. This is considerably better than some receivers using the same number of stages *and* delayed A.V.C.

Per pro ELDECO RADIO, LTD.,
R. C. RICKARD.

London, W.1.

ON WHAT AUTHORITY?

HERE is a reproduction of a notice to consumers typical of many issued by electricity supply authorities. They probably believe themselves that they are justified in insisting that wireless sets should be connected to the lighting circuit; otherwise they would surely not have the audacity to issue such notices.

MEXBOROUGH URBAN DISTRICT COUNCIL.

ELECTRICITY DEPARTMENT

NOTICE.

Consumers are reminded that Wireless Sets must not be used on a Heating circuit, and the employees of this Department have instructions to disconnect any apparatus which contravenes the regulations in this way.

J. B. FELTHAM, M. Inst.E.E.
Engineer and Manager.

We believe that the lighting rate can only be exacted where electricity is used for purposes of illumination, and we have already offered space in our correspondence columns to any supply authority which cares to argue the point.

READERS' PROBLEMS

THESE columns are reserved for the publication of matter of general interest arising out of problems submitted by our readers. Readers requiring an individual reply to their technical questions by post are referred to "The Wireless World" Information Bureau, of which brief particulars, with the fee charged, are to be found at the foot of this page.

I.F. Transformer Tuning

WHILE operating his superheterodyne receiver (modelled on the original Monodial), a correspondent has noticed that signal strength is appreciably increased by removing the screening cover of one of the I.F. transformers; he asks us to say what may be deduced from this experience.

It would appear probable that the transformer in question is tuned to too high a frequency. The effect of removing the cover is to increase the inductance of the coils and so to lower the resonant frequency. It is quite possible that, by this alteration, the out-of-tune circuit is accidentally brought into line with the others.

A Process of Elimination

THE circuit adopted by a reader for his four-valve battery set might have been chosen for no other purpose than to illustrate the principles of fault finding by a process of elimination! Similarly, the fault that exists provides a particularly good example of how a logical line of reasoning may be applied.

In Fig. 1 is reproduced in skeleton form the part of the receiver in question. The fault takes the form of an almost continuous rustling or "frying" noise, evident while the set is being operated as a radio receiver, but entirely absent on switching the pick-up into circuit. Removal of the H.F. valve does not lessen the noise, although, of course, it prevents the reception of signals.

As the pick-up is connected to the grid circuit of the first L.F. amplifier, it can be assumed quite definitely that from this point onwards no fault can exist, and, further, that the batteries, etc., which are common to all valves, are in order. Again, the fact that removal of the H.F. valve makes no difference indicates that the fault cannot lie in this valve or in the circuits preceding it.

All that remains, therefore, is the detector valve, and here, or in the associated circuits, the defect is certain to be found. A "frying" noise is often due to the leakage of high-tension current through a path of fairly high, but changing, resistance.

Anti-Interference Aerials

SEVERAL questions have lately been received from sufferers from man-made static on the question of fitting screened aerial down-leads as a palliative. Articles which appeared in the issue of August 18th will have already provided the answer to most of these questions, but there are one or two other points that might be cleared up.

A screened aerial down-lead can do nothing to reduce interference of the type that affects all parts of the aerial more or less equally. For instance, strong radiation from an overhead tramway line will be found almost always to come within this category. The same applies to overhead power wires, which will probably affect the horizontal part of the aerial just as much as the down-lead.

Little benefit is likely to accrue from fitting a shielded down-lead unless a good part of the aerial can be erected well clear of the source of interference.

Before going to the trouble of altering the aerial, it is a good plan to try the effect of fitting a simple filter in the supply leads of a mains-operated set. A large proportion of the interference may be reaching the receiver in this way.

From the L.F. Point of View

THERE is nothing basically wrong with tuned anode H.F. coupling, but nevertheless it has rather gone out of fashion during the last year or two. Probably the most serious objection that can be urged against this system is that it allows L.F. impulses to be fed back directly to the detector grid from the source of H.T. supply, and thus L.F. oscillation or motor-boating may be provoked.

Short of employing some other form of H.F. coupling, the only way to prevent this kind of feed-back is to employ, in the anode circuit of the H.F. valve, a suitable decoupling system. The values of the decoupling components must be effective both at H.F. and L.F.; the usual 1,000 ohms and 0.1 mfd. is almost useless.

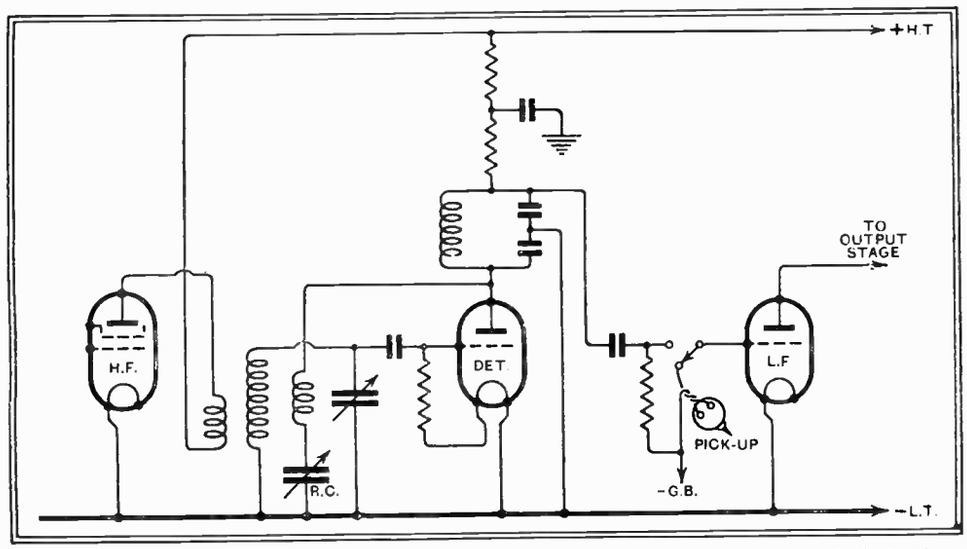

Fig. 1.—A simplified circuit diagram to illustrate the tracing of faults by a process of elimination.

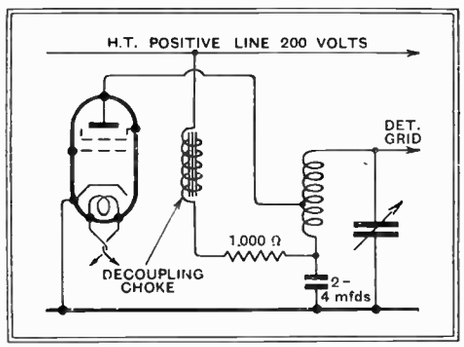

Fig. 2.—Reducing voltage loss: decoupling for a tuned-anode H.F. stage.

A reader who has constructed an H.F.-det.-2 L.F. set with a tuned anode H.F. coupling finds that motor-boating can only be prevented by inserting such a large value of decoupling resistance that the sensitivity of the H.F. stage is seriously impaired.

In asking our advice, he says nothing about the capacity of the associated by-pass condenser; if he has not tried a large capacity (from 2 to 4 mfds.) we recommend him to do so. If this course fails, we suggest the use of a high-inductance choke as a decoupling device in the manner shown in Fig. 2; this should give good L.F. decoupling without undue loss of H.T. voltage.

As there is a faint possibility that this choke may be ineffective as an H.F. decoupling device, the existing 1,000-ohm resistance might be left in circuit, as indicated in the diagram.

As You Were

THE practice of fitting "noise suppressors" in sets with A.V.C. seems to have given rise to a misconception as to the "background noisiness" of sets with this form of control.

For instance, a correspondent, who is undecided as to whether to fit automatic volume control, appears to think that this addition to his set will result in a noisier

The Wireless World INFORMATION BUREAU

THE service is intended primarily for readers meeting with difficulties in the construction, adjustment, operation, or maintenance of wireless receivers described in *The Wireless World*, or those of commercial design which from time to time are reviewed in the pages of *The Wireless World*. Every endeavour will be made to deal with queries on all wireless matters, provided that they are of such a nature that they can be dealt with satisfactorily in a letter.

Communications should be addressed to *The Wireless World* Information Bureau, Dorset House, Stamford Street, London, S.E.1, and must be accompanied by a remittance of 5s. to cover the cost of the service. The enquirer's name and address should be written in block letters at the top of all communications.

back-ground than previously, and that a suppressor will be virtually necessary.

This is a mistake. Automatic volume control does nothing whatever to increase background noises, but it does rather tend to make these noises more evident. This is because the set, when tuned to a powerful carrier wave is automatically desensitised, and if the ratio of signal-to-noise is favourable the background will appear to be quiet.

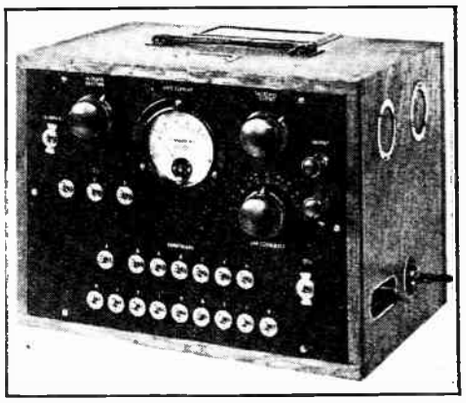
Noise suppression in A.V.C. sets is a luxury and a desirable refinement, but it is by no means a necessity.

Building the New Monodial

IT is perhaps as well to point out that, in assembling the new Monodial Super, it is necessary that the ganged tuning condenser should be raised above the baseboard by interposing the distance pieces (or spacing tubes) supplied with the condenser. Otherwise the height of the spindle will be found unsuitable for the special dial which was used in the original model.

NEW MAINS-OPERATED AUDIO-FREQUENCY OSCILLATOR

DESIGNED especially for laboratory use, the new A.C. mains-operated audio-frequency oscillator introduced by Standard Telephones and Cables, Ltd., Connaught House, Aldwych, London, W.C.2,



Mains-operated audio-frequency oscillator, a Standard Telephones product.

covers a range of 20 to 10,000 c/s in a number of graduated steps. The circuit consists of three valves, an oscillator, an amplifier, and a mains rectifier for H.T. supply, and provision is made for checking the frequency on controlled 50 c/s supply mains.

The output has a very small harmonic content, hum level is low, and the frequency stability is within ±0.2 per cent. throughout.

The construction follows conventional wireless practice, for all components are mounted on a stout metal chassis and housed in a strong oak cabinet fitted with a carrying handle, the price is £42.

A thermo-ammeter set and an attenuator are available; the former costs £12 10s. complete, while the price of the latter is £15.

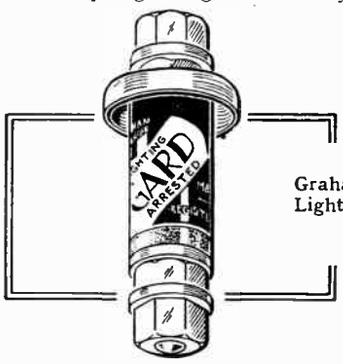
This instrument will serve for test and measurements on L.F. amplifying equipment, L.F. components, as well as for inductance and capacity bridge work.

LABORATORY TESTS

A Review of Manufacturers' New Products

GRAHAM FARISH LIGHTNING GARD

AT this season there is always the possibility that an outdoor aerial may be struck by lightning. Admittedly the risk



Graham Farish Lightning Gard

is small, but as adequate safety devices are now obtainable at small cost it is hardly worth while exposing the receiver to this danger, for far more serious consequences than a damaged set may result.

The Graham Farish Lightning Gard has been designed to afford protection in such cases, and it consists of an insulated barrel into each end of which is screwed a brass stud. These are separated by a thin annular washer. The device must, of course, be located outside the building so that a direct path to earth is available.

The aerial down lead and the lead to the aerial terminal of the set join to the top terminal on the Gard, while the lower terminal is joined direct to an earth connection. The earth wire from the set can be taken either to the same earthing point or to any other that may be convenient inside the building.

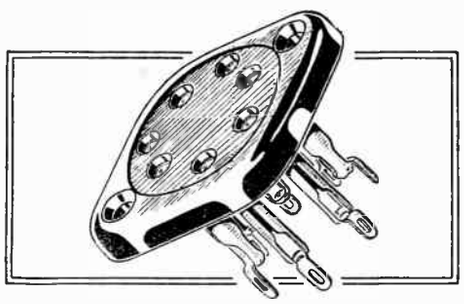
The device in no way affects reception, but in the event of the aerial being struck by lightning the charge ionises the small spark gap and passes direct to earth.

The price is 1s. 6d., and the makers are Graham Farish, Ltd., Masons Hill, Bromley, Kent.

PREH SEVEN-PIN VALVE HOLDER

A SEVEN-PIN valve holder for chassis mounting, and suitable for use with Class "B" output valves, has been introduced by the Preh Manufacturing Co., Ltd., 13-15, Broadwater Road, Welwyn Garden City, Herts. The sockets are made from phosphor-bronze strip, bent and shaped to form a resilient contact for the pins. These are assembled on a moulded bakelite base.

Several different makes of Class "B" valves were inserted in the holder, and in



Preh seven-pin valve holder suitable for Class "B" output valves.

every case a perfectly satisfactory contact was made between the valve pins and their respective sockets. Although rigidly fixed to the base plate, the sockets possess sufficient resilience to ensure correct alignment in all cases, for the valve slides into its socket quite smoothly and without undue pressure.

Soldering tags, which are part of the socket, are provided, and the price is 1s.

DISTANT RECEPTION NOTES

MONTE CENERI has definitely closed down for alterations and will not be at work again until towards the end of September. Kalundborg, therefore, remains clear, and is providing very fine reception at present.

I had thought that the transmission interfering with Huizen on 1,875 metres was Kaunas, but I have now identified it as a Russian station. Interference has been very severe on some recent days.

Last year Mexico, Cuba, the Argentine and a number of other countries in South America brought high-powered transmitters into operation. The range of many of these stations was so great that they were very well heard in this country. A great deal of interference was caused with U.S.A. transmissions and it was decided to call a Pan-American Conference to try to straighten matters out.

That conference is sitting at the present time, and high hopes are entertained that its deliberations will be successful. It is all to the advantage of long-distance listeners in this country that they should, for last winter one not infrequently found Argentine stations jamming those in the U.S.A. and vice versa.

Now that the evenings are drawing in numbers of medium-wave stations are to be received at any time after about 7 p.m., and by eight o'clock even with a smallish set one has as big a selection of alternative programmes as could be desired.

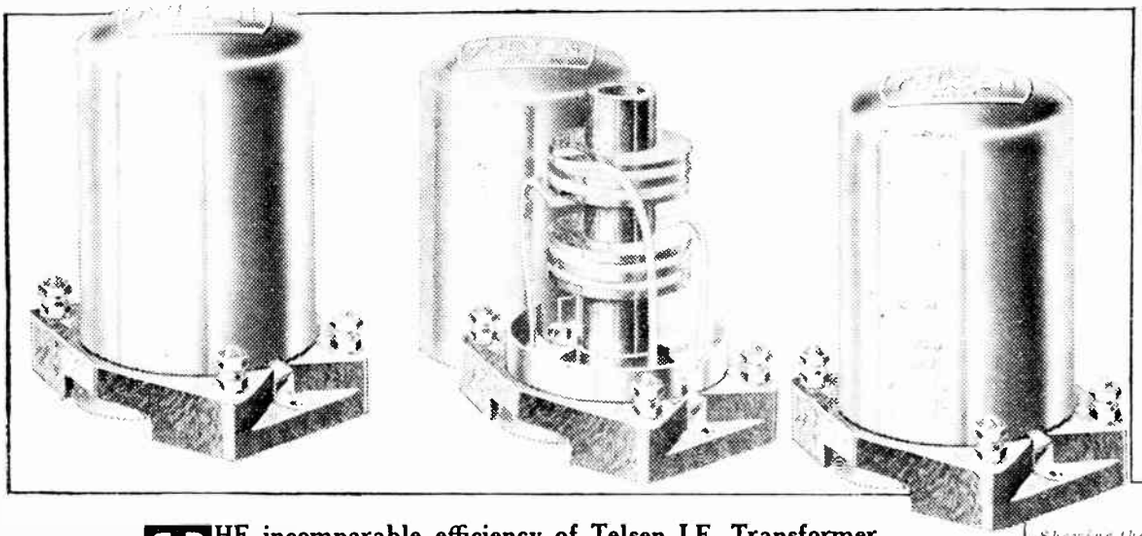
Motala continues to come through well on the long waves. Other good stations between 1,000 and 2,000 metres are Huizen (Hilversum programmes), Radio-Paris, Warsaw and Kalundborg.

Between 200 and 550 metres Prague, the Poste-Parisien, Langenberg, Breslau, Heilsberg, Toulouse, Rome, Strasbourg, Beromünster, Stockholm, Leipzig and Vienna are nearly always to be found coming in well when required. Stations now returning to form are Brno, Belgrade, Berlin Witzleben, Katowice, Bordeaux, Genoa, Bratislava, Moravska-Ostrava, Hörby, Frankfurt and Gleiwitz.

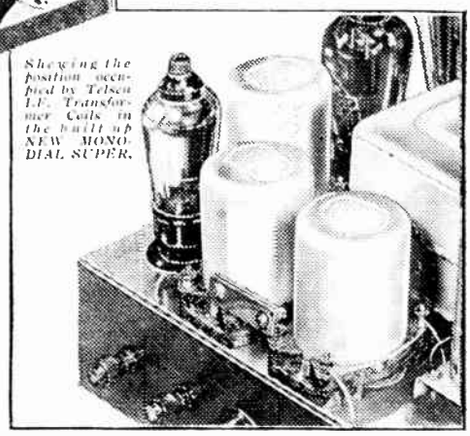
D. EXER.

Theory of Thermionic Vacuum Tubes, by E. Leon Chaffee, Ph.D. Written primarily as a textbook based on the author's lectures at Harvard University, it comprises a very complete book of reference on matters relating to low-power valves. The author states that a second volume dealing with power amplifiers, rectifiers, etc., is in preparation. Pp. 652 + xxiii., with 362 diagrams and 6 plates. Published by McGraw Hill Publishing Co., Ltd., New York and London. Price 36s.

Three TELSEN I.F. TRANSFORMER COILS *are specified for the* 'NEW MONODIAL SUPER'



THE incomparable efficiency of Telsen I.F. Transformer Coils makes them the first choice for every superhet. Each Coil consists of two tuned circuits, comprising a band-pass intermediate frequency filter tuned to 110 k.c. by two pre-set balancing condensers fitted in the base. These condensers can be adjusted for different values of stray capacities, by means of the small milled wheels projecting from the sides of the base, the filter coupling also being adjustable for optimum conditions of quality and selectivity. The designer of the famous NEW MONODIAL SUPER acknowledged the pre-eminence of these outstanding coils by specifying them in his set. Follow his lead. Insist on Telsen I.F. Transformer Coils whether you build the NEW MONODIAL SUPER or any other good superhet. Price per coil - - - - - - - - **7/6**



Showing the position occupied by Telsen I.F. Transformer Coils in the built up NEW MONODIAL SUPER.

TELSEN FOR EVERYTHING IN RADIO

ANNOUNCEMENT OF THE TELSEN ELECTRIC CO., LTD., ASTON, BIRMINGHAM

Advertisements for "The Wireless World" are only accepted from firms we believe to be thoroughly reliable.

MISCELLANEOUS ADVERTISEMENTS

NOTICES.

THE CHARGE FOR ADVERTISEMENTS in these columns is

12 words or less, 3/- and 3d. for every additional word.

Each paragraph is charged separately and name and address must be counted.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions 5%; 26 consecutive, 10%; 52 consecutive, 15%.

ADVERTISEMENTS for these columns are accepted up to **FIRST POST** on **MONDAY MORNING** (previous to date of issue) at the Head Offices of "The Wireless World," Dorset House, Stamford Street, London. S.E.1, or on **SATURDAY MORNING** at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

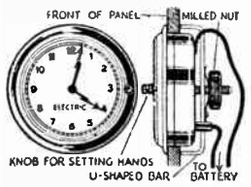
Advertisements that arrive too late for a particular issue will automatically be inserted in the following issue unless accompanied by instructions to the contrary. All advertisements in this section must be strictly prepaid.

The proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Notes being untraceable if lost in transit should not be sent as remittances.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement and the date of the issue in which it appeared

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.



FIT THIS ELECTRIC CLOCK TO YOUR SET!

NO MAINS NEEDED! KEEPS CORRECT TIME! NO WINDING!

Works off small battery lasting 12 months, or can be plugged into G.B. Battery without affecting reception. Uses practically no current. Fits into hole 3¼" dia. in any panel up to ½" thick. Easy to fix—no screws required. Only ¾" from front of panel to back of case. Swiss movement. Hands set from front. Nickel plated bezel. Useful addition to any set.

Now the Show is over....

and reflection is the order of the day, there is no doubt that the "W.W."

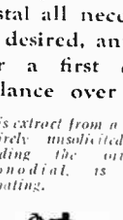
NEW MONODIAL

will be the choice of the radio connoisseur.

IN response to many queries last month, we are again offering our Monodial constructional and servicing facilities to readers in all parts of Great Britain. Consult us NOW! You will benefit by our condensed experience gained in building and servicing sets for "W.W." readers during the *last 7 years*.

Our Workshops test apparatus has been considerably augmented and we are ready to build for you a de-luxe NEW MONODIAL and if necessary to fit it in a period cabinet, and to supply and instal all necessary associated components. If desired, any apparatus can be supplied for a first deposit of 12½% with the balance over 1 year.

This extract from a letter entirely unsolicited regarding the original Monodial, is illuminating.



"I should like to place on record my appreciation of the excellent job you have made of the Monodial Superhet set which I recently ordered from you. Results have been most pleasing and I am highly satisfied with the whole outfit . . . . . I shall have great pleasure in recommending your Firm to any of my friends . . . . ."

SCOTT SESSIONS & CO.,

Radio Engineers and Consultants,
MUSWELL HILL, LONDON, N.10

Cables: "Tropiset, London."
Contractors to H.M. Government Depts., &c.

NUMBERED ADDRESSES.

For the convenience of private advertisers, letters may be addressed to numbers at "The Wireless World" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Wireless World." All replies should be addressed to the Box number shown in the advertisement, c/o "The Wireless World," Dorset House, Stamford Street, London, S.E.1. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes: in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

DEPOSIT SYSTEM.

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Wireless World," both parties are advised of its receipt.

The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50, 5/-. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.—Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

RECEIVERS FOR SALE.

ARMSTRONG Latest Universal A.C. D.C. 4-valve Chassis, specially efficient S.G. circuit, pentode output: 75/-; with 5 valves, 114/-.

ARMSTRONG 1934 Battery 3 Chassis, metal Construction, 2 tuned circuits, S.G., pentode output, built-in speaker, 45/- with valves 69/-; above chassis have remarkable performance, 2 years' guarantee, approval.—Armstrong Co., 100, King's Rd., N.W.1. [3395

NEWMAN, 303, Roman Rd., E.3. [2892

ALL Types of Brand New American Valves in Stock, first class makes: 247s, 235s, 224s, 236s, 237s, 233s, 245s, 244s, 12/-; 227s, 226s, 280s, 245s, 9/6; 242s, 232s, 11/-; U.X.210s, 15/-; U.X.250s, 7 watts output, 16/-; 281s 14/6; post paid, cash with order or c.o.d. Send for valve list.—Ward, 12, Tredegar Rd., Bow, E.3. Tel.: Advance 3668. [3364

COMPONENTS, ETC., FOR SALE.

R.

SELECTED Parts for Sale, as new; any c.o.d. or "Wireless World" deposit system, which we recommend if in doubt as to the splendid value offered; we take risk of damage in transit to our customers; goods tested for callers and guaranteed.

AMPLION Public Address Microphone, £3; Ready Radio Senior Instrument matching transformers, new, 10/25-1, 15/9; G.E.C. Senior induction motor, 47/6; set Colvern battery Super Five coils, 10/-; set Colvern single dial super battery coils, 15/-; Mullard H.T. eliminator, complete, 150v. 30m.a., 240v. input, 30/-; Six-Sixty eliminator, 200v. 25m.a., and G.B., 32/6; Ekco A.C.25, 47/6; Atlas A.C.244, 39/6.

PAIR Varley Q.P.P. Input and Output, 19/-; Wearite and Lewcos super het. coils, 5/-; 3-range oscillators, 7/6; 8-way bases, 4/6; K.B. universal gramophone motor, auto stop, 16in. turntable, 30/-, new; T.C.C. 2,000mf. electrolytic, 9/-; T.C.C. ditto, 250mf. 100v., 8/6; Novotone J., 30/-; Igranic L.F. choke coupling units, 3/9; Lotus new 4-gangs, 15/9.

RYALL'S Mains Condensers, 4mf., 250v. working, 2/6; 4mf., 500v. working, 4/6; 4mf., 750v. 6/6; 2.000v., 17/6; Ryalls condenser blocks, 2-4mf., 2-2mf., 500v. working, 8/6; Dubilier 2×2, 500v. working, 2/6.

RYALL'S Mains Transformers, 250v. 60 m.a., 4v. 1 amp, 4v. 3 amp., 10/6; 350v., 12/9; H.T.7, with 4v. 4 amp., 10/6; 4v. 3 amp only, 6/9; chokes, 25h. at 60m.a., resistance 260 ohms., 6/9; 20h. at 100m.a., 8/9; 10h., 8/9, for Monodial; 40h. at 100m.a., 10/6.

RYALL'S RADIO Offer Reliable Resistances, 1 watt, suitable for all "Wireless World" sets where a 1 watt resistance is specified, in values 100, 500, 1,000, 2,000, 5,000, 6,000, 10,000, 25,000, 30,000, 75,000, 150,000, 250,000, 20,000, all values stated in ohms, 6d. each, guaranteed one year, wire ends, new goods.

WE Hold a Large Stock of First Class Radio Apparatus, meters, resistances, condensers, heavy chokes, and all set requirements, at bargain prices, all modern goods.

RYALL'S RADIO, 33, Chancery Lane, London, W.C.2 (nearest Tube Chancery Lane; 'bus 67 passes door, or tram to Savoy St.). Holborn 3529. Open Saturday afternoon. Close 7 p.m., Thursdays 1 o'clock, Saturday 6p.m.

PREMIER Summer Sale.

THE Last Week.

10% Discount on All Orders of £1 and Over.

MANY Prices Reduced Apart from Discount.-

PREMIER SUPPLY STORES Offer the following Set Manufacturers' Surplus New Goods at a fraction of the Original Cost, all goods guaranteed perfect, carriage paid over 5/-, under 5,- postage 6d. extra (Ireland, carriage forward).

ELIMINATOR Kits, including transformer, choke, Westinghouse metal rectifier, T.C.C. condensers, resistances and diagram. 120v. 20 m.a., 20 -; trickle charger 8,- extra; 150v. 30 milliamps. with 4v. 2-4 amps. C.T., L.T. 25/-; trickle charger 6/6 extra; 250v 60 milliamps, with 4v. 3-5 amps. C.T., L.T. 30 -; 200v. 100 milliamps. with 4v. 3.5 amps. C.T., L.T. 49/6; 300v. 60 milliamps. with 4v. 3-5 amps. C.T., L.T. 37/6.

ELLIOTT First Grade Moving Coil Meter- in the Following Ranges:—0-10, 0-30, 0-50, 0-100, 0-150 milliamps., also 250v flush type, 17/6, projecting 15/-.

ROLA Moving Coil Speakers, complete with humbucking coils and output transformer; please state whether power or pentode required; F6 2,000 or 6,500 ohm, listed 35/-, at 17/6; F7, 2,000 or 6,500 ohm, listed 47/6, at 23/6; A.C. conversion kit for any of above, 10/-.

SPECIAL Offer.—Reisz type microphone with transformer, a really professional job, listed at £12; our price 52/6.

HEAVY Duty Variable Resistances, wound on porcelain, 2,000 ohms 1-4 amp., 5,000 ohms 1-2 amp., 120 ohms 1 amp., all the above values, 3/6 each.

T.C.C. Condensers 750v. working, 2 mf. 3/6, 4 mf. 6/-, 4 mf. 400v. working 4/-, 250v. working 1 mf. 1/-, 2 mf. 1/9, 4 mf. 2/6, 1,500v. working Standoff insulators .5 mfd. 1/6, 2 mfd. 6/-, aqueous electrolytic 440v. working, 4 mf. 3/-, 8 mf. 3/6.

DUBILIER Condensers.—.01 mica 6d., .01 mica 1,000v. working 1/-.

ALL the Following Lines 6d. each or 5/- per dozen: 4 and 5 pin chassis mounting valve holders; shielded screen grid or pentode leads 1-watt wire end resistances, any value; T.C.C. .1 condensers; hum dingers; on-off switches push-pull, polar ganging devices.

FERRANTI Condenser Blocks 300v. working 4 4 2-2, all separate, 5/-.

POLAR 3-gang 0.0005 Condensers, split end vanes, totally screened, disc drive; 6/11.

AMSCO Triple-gang 0.0005 Condensers, with trimmers, 4/11.

ORMOND 0.0005 Condensers, 1/3; 2-gang semi shielded, 2/6.

WESTERN ELECTRIC Main- Transformers, input 200-250 volt, output 500-0.500 volt, at 150 milliamps., 4v. 4a., 4v. 2.5a., 4v. 2a., 4v. 1a., 4v. 1a., massive job; 19/6.

T.C.C. Electrolytic Condensers, 10 mfd., 100 volts working, 1/-; 15 mfd. 1/3.

SPECIAL Offer of Mains Transformers manufactured by Philips, input 100-115v. or 200-250v., output 180-C.180 volts, 40 m.a. 4v. 1a., and 4v. 3a., 4/6; 200-0.200v., 4v. 1a., 4v. 3a., 4/6.

ALL Premier Guaranteed Mains Transformers have engraved terminal strips with terminal connections, input 20 250 volts, 40 100 cycles, all windings paper interleaved.

PREMIER H.T.8 Transformer, 250v. 60 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 25/-.

PREMIER H.T.9 Transformer, 300v. 60 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26/-.

PREMIER H.T.10 Transformer, 200v. 100 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26/-.

PREMIER Mains Transformer, output 135v. 80 m.a., for voltage doubling, 8/6; 4v. 3-4a. c.t. L.T. 2/- extra; Westinghouse rectifier for above, giving 180v. 30 m.a., 8/6.

PREMIER Mains Transformers, output 250-0-250 volts, 60 m.a., 4v. 1-2a., 4v. 2-3a. 4v. 3-4a. (all c.t.), with screened primary; 15/-.

PREMIER Mains Transformers, output 350-0-350 volts, 90 m.a., 4v. 3-5a., 4v. 2-3a. (both c.t.), with screened primary; 15/-.

PREMIER Mains Transformers, output 400-0-400 volts, 100 m.a., 4v. 4-5a., 4v. 2-3a., 4v. 2-3a., with screened primary; 15/-.

PREMIER Auto Transformers, 100-110 200-250 volts or vice versa, 60-watt, 7/9; 100 watt, 10/-.

SPECIAL Offer of Manufacturers' Type Transformers, any input, output 250-0-250 volts, 60 m.a., 4v. 1a., 4v. 3a. (both c.t.), 8/6; H.T.8 transformer, with 4v. 3-4a. (c.t.), 8/6; with rectifier, 18/6.

AMPLION Mains Transformers, input 100-250 volts, output 350-0-350 volts, 120 m.a.; 4v. 5a., 4v. 2a., 6v. 1a. (all c.t.): 17/6.

FILAMENT Transformers, polished and engraved terminal boards, N.P. terminals, 4v. 3-4a., 5/-; 10v. 3a., 6/6; 12v. 1a., 5/-; 4v. 4-6a., 6/6; 14v. 4a., 6/6; 22v. 1a., 6/-; 6v. 2a., 5/-; 9v. 1a., 5/-; 35v. 3a., 15/-.

PREMIER Chokes, 40 m.a., 25 hys., 4/-; 65 m.a., 30 hys., 6/-; 150 m.a, 30 hys., 10/6.

PYE Chokes, 20 or 32 hys., 4/-; Premier multi-ratio output transformers, giving 15 different ratios 7/6.

(This advertisement continued from previous page.)

PREMIER Eliminators, input 200-250 volts, 40-100 cycles, A.C., incorporating Westinghouse metal rectifiers, output 250v. 60 m.a., S.G. and 120v. taps, 42 6; with 4v. 4a. c.t. L.T., 7 6 extra.

BRITISH RADIOPHONE Wire Wound Potentiometers, with mains switch incorporated, 5,000 ohms, 10,000 ohms, 50,000 ohms, 100,000 ohms, 250,000 ohms, any value; 3 6.

PREMIER Eliminators, output 150v. at 30 m.a., S.G., and 100v. taps, with 4v. 3-4a. c.t. L.T., 37 6; or with trickle charger, 42 6.

PREMIER Eliminators, output 120v. at 20 m.a., S.G., and 100v. taps, 27 6; with L.T. trickle charger incorporated, 35 -.

PREMIER D.C. Eliminators, output 120v. at 20 m.a., S.G. and 100v. taps; 15 -.

ACCUMULATOR Chargers, 200-250 volts A.C., all incorporating Westinghouse metal rectifiers; 2, 4, and 6v. at ½ amp., 12 6; 2, 4, and 6v. at 1 amp., 17 6; 12v. 1a., 27 6; 6v. 2a., 35 -; 12v. 2a., 35 -; 12v. 1.5a., 30 -; 6v. 3a., 39 6; 30v. 3a., 42 6.

AMPLION High Inductance Chokes, resistance 2,500 ohms, 80 henries 60 m.a.; 5 6.

WESTINGHOUSE Metal Rectifiers: 120v. at 20 m.a., 6 6; 180v. at 30 m.a., 8 6; 8v. at ½ amp., 6 6; 6v. at 1 amp., 9 6.

KOLSTER BRANDES Electric Gramophone Motors, complete with turntables and automatic stop, 100-250v., A.C. and D.C.; list price £5, to clear £2.

B.T.H. Induction Type (A.C. only) Electric Gramophone Motors, 100-250v.; 30 - complete.

AMPLION Moving Coil Speakers, type E.M.644, dual fields, 2,500 and 5,000 ohms (100 and 200v.), with output transformer, 12 6; A.C. conversion kit for this speaker, 10 - extra.

WESTERN ELECTRIC Condensers, 250v. working, 1 mfd. 6d., 2 mfd. 1 -; 500v. working, 1 mfd., 1 -.

T.C.C. Condensers, 250v. working, 4×4 - 1 mfd., 3 6; 300v. working, 4×4×2×2×2 mfd., 6/-; 6×4×4×2×2×2 mfd., 375v. working, 6 11; 4×4×4×1, 6 -.

SPECIAL Offer of Wire Wound Resistances, 4 watts, any value up to 10,000 ohms, 1 -; 8 watts, any value up to 15,000 ohms, 1 6; 15 watts, any value up to 50,000 ohms, 2 -; 25 watts, any value up to 50,000 ohms, 2 6; 50 watts, any value up to 50,000 ohms, 3 6.

WIRE Wound Potentiometers, 15,000 ohms, 1 6; Centralab Potentiometer volume controls, 50,000 ohms, 2 -; wire wound Clarostat Potentiometer, 50,000 ohms, 2 6; Colverstats, logarithmically wound Potentiometers, 6,000 ohms, 1, 9.

FOR Callers only.—The following valves, guaranteed new:—

THE Last Few Western Electric 3211-D Valves, 10v. 3a. filament, 750 1,000v. plate, 50-65 m.a., impedance 3,500 ohms, amplification factor 12; cost £5; to clear at 15 -.

PHILIPS 328 Valves for L.T. Charging, 5 6; 329 Barreter lamps, 2/-.

HARLEY Pick-ups with arm and volume control; 12 6.

PREMIER SUPPLY STORES, 20-22, High St., Clapham, S.W.4. Macaulay 2188. Closed 1 o'clock Wednesdays, open to 9 o'clock Saturdays. Nearest Station, Clapham North Underground.

GENUINE Manufacturers' Surplus by Leading Makers.

DOUBLE Smoothing chokes mounted, sound robust job, 120 m.a., 14-28 henrys each, usual price 35 -, our price 6 6 each, 9d. postage; single ditto, 4 6 each.

CHOKES, small, iron cored, 2,000 ohms for output or choke coupling; 1 6 each, 3d. postage.

A.C. H.T. Eliminator 220 V to 240 V with 4 tappings; total output 150 V at 25 m.a.; for use with D.W.2 or Phillips 1821 valve; price 35 -, carriage 1 3.

MAINS Transformers for Eliminators, output 250-0-250 at 60 M.A., 4 V at 1 Amp; state input when ordering; price 6 6, postage 9d.

14 mfd. Block Condensers, 250 V a.c. working, 6-4-2-1-1, 4 - each, postage 6d.

RESISTANCES, wire wound, finest quality at ridiculous prices: 3,000, 5,000, 8,000, 40,000, 65,000 ohms, all 5 Watt, worth 3 6 each; 6d. each, post 3d.

WIRE Wound Potential Dividers, 60 Watt wound three sections, 4,500 ohms, 3,000 ohms, 2,000 ohms, 1 6 each, postage 4d.; 5 Watt ditto, 20,000 ohms, 20,000 ohms, 20,000 ohms, 1 - each, postage 3d.

POTENTIAL Dividers wound 2 sections, 5 Watt; 40,000 and 23,000 ohms; 40,000 and 80,000 ohms; 40,000 and 100,000 ohms; 30,000 and 50,000 ohms at 1/- each, postage 3d.

POTENTIAL Dividers wound 5 sections, 5 Watt; 250, 165, 100, 100, 100 ohms; 1 6, postage 3d.

2 Separate 60 Watt Resistances on One Tube, 2,500 ohms and 500 ohms, 1 6 each, postage 4d.

3 Separate Resistances on One Tube, 2,500 ohms, 1,000 ohms, 30 ohms; 1 - each, postage 3d.

100 000, 200,000, and 300,000 ohms 1 Watt Type Resistances at 4 6 per dozen, postage 3d.

2 MEG, 0.1 Meg, 0.5 Meg Leaks; 0.001, 0.0001, 0.015 fixed condensers all 3 - per dozen, postage 3d.

R. C. Coupling Units, 1/- each, postage 3d.

1 MFD Condensers, 250 V d.c. working, 6d. each, postage 2d.; 4 mfd condensers, 250 V d.c. working, 1 6 each, postage 4d.

GOODS Order value 20 -, carriage free.

EACH Article is tested before despatch and guaranteed first cross manufacture; cash with order; all goods despatched same day.—Surplus Radio, 32, Queensway, Penders End, Middx. [3252

SOUTHERN RADIO Wireless Bargains.—Set manufacturer's guaranteed surplus:—

VARIABLE Condensers.—British Radiophone 4-gang superhet type, fully screened and trimmers, 0.0005, 8 9 (list 45 -). Same type, complete with dial knob and escutcheon, 12/9 (list 50 -). Hydra block condensers, new, 16 mfd., 2+2+8+2+1+1, 1,000 volt test (made for Canadian Marconiphone Co.), 8 9; 4 mfd., 2 6; 2 mfd., 1 9; 1 mfd., 1 -; all 750 volt. Polar 3-gang condensers, 0.0005, fully screened, complete trimmers, dial, knob, escutcheon; 11/-.

SPEAKERS.—Celestion Soundex permanent magnet, 16/- (list 27 6); Rola F6 permanent magnet, 28/- (listed 49 6); D.C. mains energised, 2,500 to 6,500 ohms, complete with humbucking coils and transformers, 16 6 (list 39/6); Peter Graesman dynamic speakers and chassis, 10/6 each (list 35 -); G.E.C. Stork speakers, complete in magnificent cabinet, 19 6 (listed £3 15); Ormond speakers, complete in cabinets, 10 - (listed 25/-). Dr. Nesper Tefag speakers, 11 6 (listed 55 -).

CONSTRUCTORS' Kits.—Ready Radio "303" battery 3-valve kits, less valves, 18/- each; complete with 3 Mullard valves (P.M.1LF., P.M.2, 2D.X.), 33/- each (list 70 -); Ready Radio Meteor screen grid 3-valve kit, less valves, 26 -; with 3 Mullard valves (P.M.12a, P.M.2D.X., P.M.2a), 49 - (list £5 7/6); Universal Radio 3-valve kits, ready assembled on chassis, 12/6 (listed 45 -).

READY RADIO S.T.400 Kits, as specified by Scott Taggart; £2 19/6 each (list £4 17 6).

READY RADIO Meteor Screen Grid 3-valve "A" Kit, complete with cabinet, permanent magnet speaker (less valves), £3 7/6, with 3 Mullard valves, £4 10 (list £8/17 6); Mullard Radio for Million 3-valve A.C. kit, complete with 3 Mullard A.C. valves (Pen. 4V, 354V, S.4V), £3 10 (list £6 10); Mullard Radio for Million 3-valve battery kits, complete with 3 Mullard valves, £3 3 (list £6 2 6); all kit brand new, in original sealed cartons.

BRITISH General Tuning Units, Band Pass, 10 k.c., aerial or anode; 5/- (list 14/6).

ALL Goods Guaranteed New and Perfect, and sent carriage paid.

PLEASE Note.—We have opened branches at 271-275, High Rd., Willesden Green, N.W.10, and at 46, Lisle St., W.C.2, where callers are cordially invited to inspect our large stocks of wireless bargains. Please send all post orders to 323, Euston Rd., N.W.1.

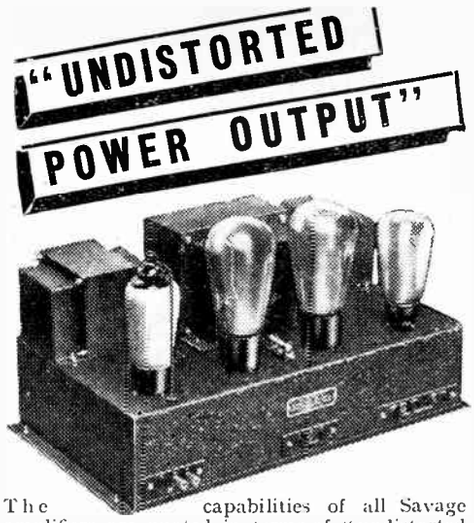
THREE Wearite Superhet Intermediates, 10/- set; 120v. wet nickel iron battery, 30/-.—Hawtrey, 3, Brocas Terrace, Eton. [3349



The capabilities of all Savage amplifiers are quoted in terms of "undistorted power output"—but in more senses than the purely theoretical one. Savage reproduction shows you just how good really good reproduction *can* be. Savage has had years of experience in amplifier work of all kinds—experience that has been turned to good account in the latest models. It is *that* that makes the difference—but come and hear Savage "undistorted power output" for yourself. Or, if you are unable to get along, write for particulars stating the class of amplifiers in which you are interested. No obligation, of course.

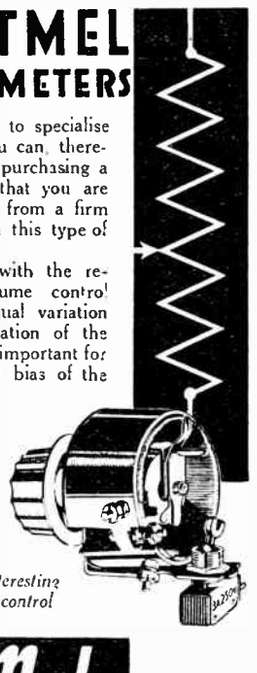
For PERFECT VOLUME CONTROL — WATMEL POTENTIOMETERS

Our Policy this year is to specialise in Potentiometers. You can, therefore, be certain when purchasing a Watmel Potentiometer that you are obtaining the very best from a firm that is concentrating on this type of component.

This resistance meets with the requirements for a volume control which will have an equal variation of volume for the rotation of the knob. This is specially important for the control of the grid bias of the new variable-Mu valves.



Here is illustrated the Watmel Type 2 Potentiometer with mains switch.

Price
Square Law Winding 8/6
Without Mains Switch 6/6
Type 1.
Standard Winding 5/-

Please write for the interesting Watmel book on volume control Free.

WatMel POTENTIOMETERS GIVE THE BEST CONTROL

This is not a correspondence college. Apparatus of all leading makes installed for instructional purposes. Boarders accepted. Training fees can be paid after appointment. Prospectus free.—Wireless College, Colwyn Bay. [0288

Your complete guide to the construction of Radio Power Units. A 32-page publication which deals fully and clearly with the theory and practice of the subject, giving full working instructions and diagrams for the building of eight different units—AC and DC—from modest to super-power output.

Published by Ferranti, it may be looked upon with confidence as a responsible and authoritative treatise. As such, it is only natural that the components recommended are of unsurpassed quality and unquestioned reliability. The fact that many of these components bear the Ferranti name will be taken as a guarantee that the completed Power Units are entirely safe and exceptionally efficient.

This Booklet W522, as well as a 16-page list of all Ferranti Mains Components, will be sent, post free 4½d. Address enquiries to Dept. "W."

The full range of Ferranti Mains and General Radio Components may be inspected at Stand No. 38, Scottish National Radio Exhibition, Glasgow: also at Stand No. 20, Main Hall, Northern National Radio Exhibition, Manchester.

Radio Data Charts. For the keen amateur. By post, 4/10.

The *plate-less*
ACCUMULATOR
revolution

DOUBLE CAPACITY

LOW TENSION

halves your re-charging

No bigger than your present 40 a.h. accumulator, costing little more, a Block plate-less accumulator lasts you twice as long per charge—gives 80 a.h.! Far more durable, too—and handsome, in its richly coloured bakelite. (Detachable hand-lamp fitting, 10/6.)

"CONDENSED" HIGH TENSION

no need for dry battery expense

Because a Block cell gives twice the capacity for its size, a Block H.T. accumulator of usual capacity can be condensed to half the usual bulk! So give up expensive dry batteries—the new accumulator in its beautiful bakelite casket is little bigger and is remarkably inexpensive. Relieves you at once of radio's biggest nuisance.

RADIO DATA CHARTS

A SERIES OF ABACS

providing most of the essential Data required in Receiver Design

By

R. T. BEATTY, M.A., B.E., D.Sc.

Reprinted from "The Wireless World"

(1930)

"Radio Data Charts" provide designers of wireless apparatus with a ready and convenient means of solving problems without having recourse to complicated formulæ and mathematics.

By the use of the charts it is possible to tackle all the more familiar problems in radio receiver design, such as, for example, finding the relationship between inductance capacity and frequency, and working out the design of high frequency transformers. All keen amateurs will appreciate this helpful book.

(39 CHARTS and more than 50 Diagrams)

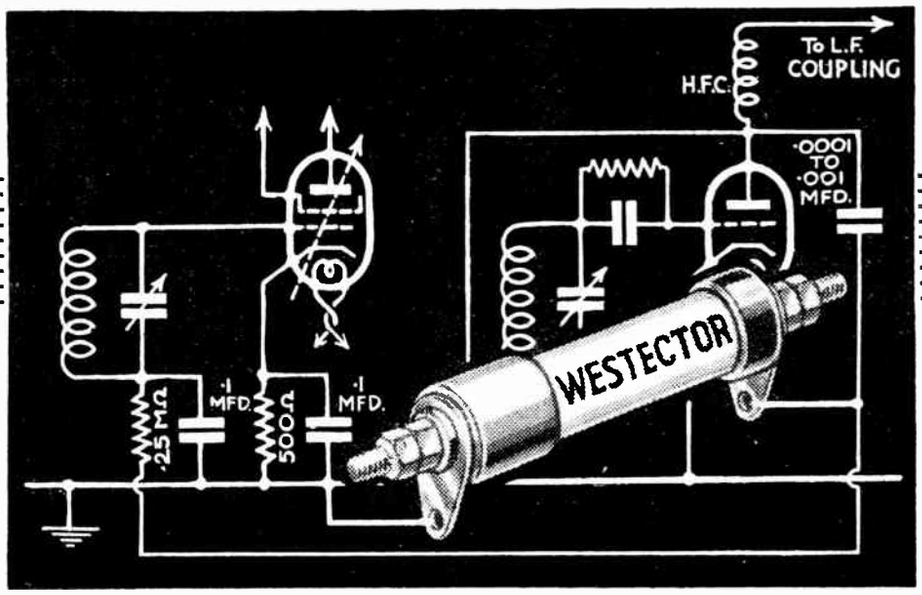
SIMPLICITY & EFFICIENCY

in Automatic Volume Control



UP to the present, the introduction of Automatic Volume Control to "straight" sets using grid or anode bend detection has necessitated very complicated and costly alterations to a receiver.

But, there is now a much simpler method of obtaining the same result, and involving no material alterations to the receiver. This is made possible by the use of the new Westector, the new high frequency metal rectifier.

The Westector is simply fitted in the detector by-pass circuit, and the D.C. component developed across it by the H.F. present, is used, after passing through a suitable resistance-condenser filter, for controlling the bias applied to the Variable-Mu H.F. Valve.

Full particulars and circuits are given in the 1934 edition of "The All Metal Way." Send 3d. in stamps for a copy.

The Westinghouse WESTECTOR

COUPON

I am interested in A.V.C. Please send me the "All Metal Way," for which I enclose 3d. in stamps.

"The Aristocrats of the Radio World"

Model 1201 AUTO
95 Gns.

These new models are a triumph of design, construction and performance, and have justly earned the title of "The Aristocrats of the Radio World." They embody all the qualities associated with the famous 901 model, and possess, in addition, refinements of the highest importance to perfect reception and reproduction. Guesswork in tuning stations is entirely eliminated; the visual tuning device shows when a station is tuned with critical accuracy. Automatic amplified volume control and silent tuning are other refinements. To hear these new models is to enjoy radio and gramophone reproduction as never before; realism and tonal beauty that defy description and evoke the highest praise.

Model 1201 Auto (A.C.)

Circuit. A 12 valve superheterodyne Radio Gramophone comprising the following:—Variable mu H.F. stage, band-pass coupled to variable mu first detector, triode oscillator, variable mu intermediate stage having six tuned band-pass circuits, followed by a double diode triode valve serving the purpose of the second detector, and **delayed action amplified automatic volume control** operating on three H.F. stages. A further triode valve is used to suppress unwanted noise when tuning between stations. The L.F. amplifier is housed in a separate chassis, and is unique in that resistance-coupled push-pull coupling is used throughout, employing a special circuit. The output stage has an **output of six watts.** *Controls.* Tuning by single control operating illuminated wavelength scale. **Tuning of stations assisted by special visual tuning device which indicates exactly when the station is in tune.** Combined volume control for Radio and Gramophone; tone control; mains switch and gramophone wave-change switch combined. *Speakers.* Twin matched energised moving coil units, mounted on special sub-baffle. Provision for use of external speakers. *Gramophone.* Automatic record changer, enabling eight 10in. or 12in. records to be played in sequence, rejected or repeated as desired, fitted with induction motor and pick-up of improved design. *Cabinet.* Of modern design, made in finely grained figured walnut. Also obtainable in special finishes, and **also in ultra modern design.**

Model 1201 is identical with Model 1201 Auto except that Gramophone is not automatic.

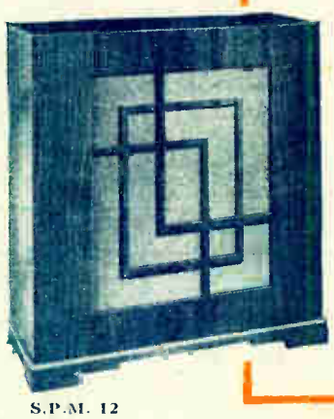
(Model 1201 Auto supplied with doors at £16 : 16 : 0 extra.)



S.P.M. 12
Dual Matched Loud Speakers.

The R.G.D. Type S.P. M12 consists of a pair of matched Permanent Magnet Moving Coil Speakers, and is designed for use with type W12 Auto Amplifier or with any R.G.D. Radio Gramophone Input capacity 12 watts undistorted A.C. The cabinet is of heavy and entirely non-resonant walnut of modern design. Dimensions 26in. × 24in. × 9in. deep.

12 Gns

Model 702 Auto (A.C. or D.C.)

Circuit. A 7 valve superheterodyne Radio Gramophone, comprising the following features:—Variable mu H.F. stage, variable mu first detector, triode oscillator, variable mu intermediate stage, incorporating 7 tuned circuits (4 band-pass), followed by new double diode triode valve, giving diode rectification, **delayed action automatic volume control,** operating on three H.F. stages, also combined with which is the first L.F. stage. This is resistance-coupled to triode output stage, giving an **undistorted output of 2½ watts.** *Controls.* Tuning by single control operating illuminated scale calibrated in wavelengths. Tuning of stations assisted by **special visual tuning device, which indicates exactly when a station is in tune.** Combined volume control for Radio and Gramophone, tone control and main switch; Radio-Gramophone and wave change control combined. *Gramophone.* Automatic record changer enabling eight 10in. or 12in. records to be played in sequence, rejected or repeated as desired, fitted with induction motor and pick up of improved design. *Cabinet* is of improved design in figured and burr walnut, also obtainable in special woods and finishes, and **also in ultra modern design.** *Speakers.* Field energised twin matched moving coil speakers and provision for external speakers.

Model 702

Circuit. A 7 valve superheterodyne Radio Gramophone having the same specification as the 702 Auto, except that the Gramophone is not automatic in action.

"My dear Watson . . . !

. . . IT IS OBVIOUS THE VALVE HAS GONE . . "

"A broken down grid bias resistance is a fault that, normally, would need some locating, Doctor, but with the aid of an 'All-in-One' Radiometer it took me very little time to test the whole set and eventually narrow down the field until the real culprit was revealed."

If YOU possess a radio set you should also possess an "All-in-One" Radiometer. With this wonderful instrument you can always keep your set in 100% condition. It tests everything quickly and surely, enabling you to keep the set up to par at all times. Ask to see it demonstrated at your radio dealers or write direct to

PIFCO LTD., High Street, MANCHESTER, or 150, Charing Cross Road, London, W.C.2.

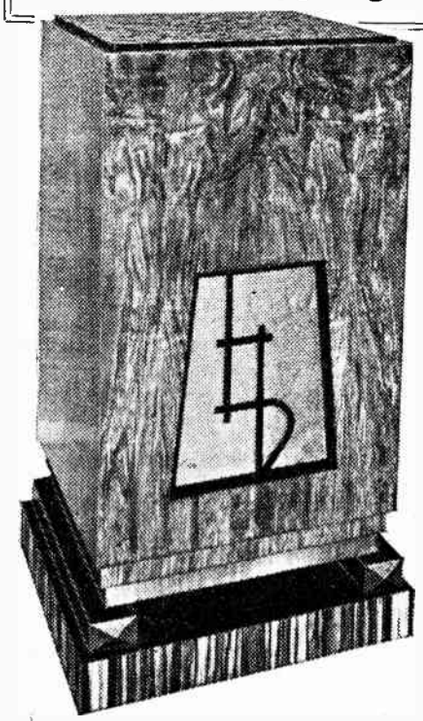
OUTSTANDING DESIGNS & WORKMANSHIP

made C.A.C. the centre of interest at Radiolympia and Glasgow

THE "WARWICK" CABINET DE LUXE

This cabinet was specially designed for "The Wireless World" New Monodial Super and is manufactured in specially selected figured walnut with ebonised base and macassar ebony base.
Also supplied as a Radiogram cabinet with raised hinged lid at an additional cost of 20/-.

Price £5 - 10 - 0



Despite the rush of orders (and there has been a *genuine* rush) at these Radio Exhibitions, we have maintained our published promise of delivery by return of post of all orders for the New Monodial Super Kit of Parts, every component being strictly in accordance with the designer's first choice.

"C.A.C." are fortunate in having the Radio Manufacturing Department and the Cabinet-making side of its business housed in a large modern Factory, covering an area of about 13,000 sq. feet, and the most up-to-date machinery has been installed.

This happy and unique combination of highly specialised Receivers, built into the best that Cabinet-makers' craftsmanship can produce, is sufficient to ensure that only Receivers of outstanding performance and appearance will be offered to the public.

TRADE ENQUIRIES INVITED

"C.A.C." KITS for *The Wireless World* NEW MONODIAL SUPER

KIT "A" RECEIVER UNIT: Comprising the Designer's first specified components (less Chassis, Panel, Valves and Cabinet) - - - - - - - - **£10-19-6**

KIT "B" POWER UNIT: Comprising the Designer's first specified components (less Chassis and Valves) - - - - **£8-13-6**

Detailed Price List Free on Application.

ALUMINIUM CHASSIS correctly drilled with side members, finished in French-grey cellulose. Receiver Chassis, **10 -**; Power Unit Chassis, **7/6**. "C.A.C." Panel, 14" × 10", in Polished Oak, Walnut or Mahogany, **2/-**. Valves: Receiver (5), **£4-4-6**. Power Unit (1), **£3-0-6**.

FERROCART CLASS "B"

KIT "A." Complete (less Valves, Batteries, Cabinet and Loud Speaker) - - **£7-11-0**

KIT "B." Complete with Valves (less Batteries, Cabinet and Loud Speaker) **£9-17-3**

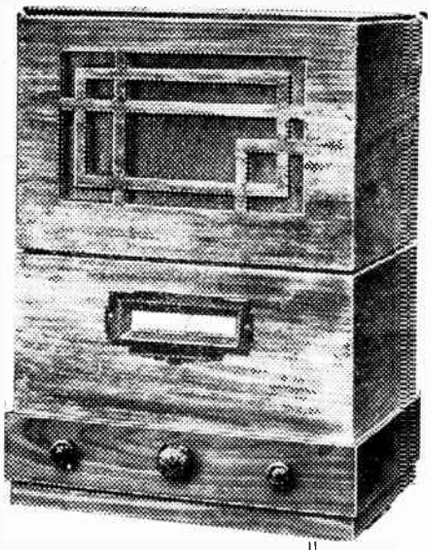
KIT "C." Complete with Valves, Cabinet and Loud Speaker (less Batteries) - **£13-9-3**

CABINET, beautifully finished in Figured Walnut exclusively specified by the designer and manufactured in our own factory - - - - - **£1-12-6**
(Front drilled, if desired, without extra charge.)

Continuous Demonstrations Daily.

CONSTRUCTION

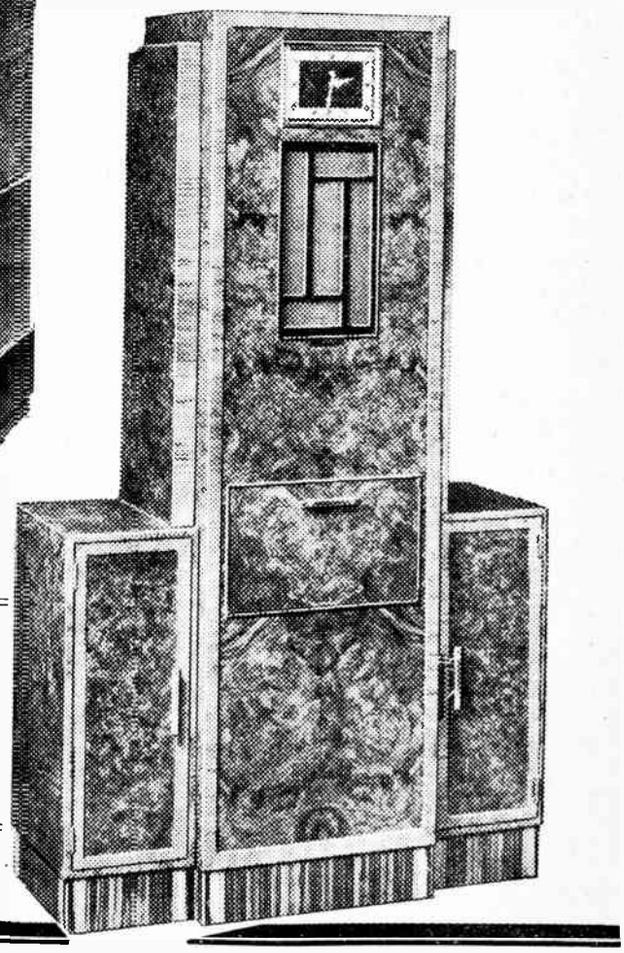
We shall be pleased to undertake the construction of the above Receivers to customers' own requirements. Only highly skilled technicians, under the personal supervision of Mr W. I. G. Page, B.Sc., are entrusted with this work. This ensures that the results obtained by the designer will be duplicated.



THE "C.A.C." PENTAGRID SUPERHET

A four-valve A.C. Superhet of highly specialised technique using a Pentagrid Converter as a single-valve frequency changer, which performs the dual functions of oscillator and first Detector in the most efficient manner known. In the I.F. stage a variable-mu Pentode is used, which adds its contribution to A.V.C. The third valve is one of the new double Diode Pentodes, which gives almost perfect automatic volume control, and the fourth valve is a Catkin Pentode. The output is in the order of 2½ watts, whilst the sensitivity of this Receiver is a revelation. The four special valves give an overall performance equal to that of any six-valve superhet on the market.

Price 14 GUINEAS



Our 1933-4 Catalogue is now ready. Send a post card for a copy to-day.

THE "C.A.C." GRANDFATHER CLOCK CABINET

This handsome and original piece of furniture represents the very last word in Radio-gramophone Cabinet design and has proved one of our most popular selling lines at Olympia and Glasgow Shows. There is provision for accommodation of almost any type of Receiver, whilst the Gramophone motor and Pick-up fit into the sliding compartment below. The two side compartments allow for the storage of gramophone records or can be fitted as a cellarette, etc. PRICE **14 GNS.**

RADIO DATA CHARTS

A SERIES OF ABACS

providing most of the essential Data required in Receiver Design

By R. T. BEATTY, M.A., B.E., D.Sc.

(1930)

Reprinted from "The Wireless World"

"Radio Data Charts" provide designers of wireless apparatus with a ready and convenient means of solving problems without having recourse to complicated formulæ and mathematics.

By the use of the charts it is possible to tackle all the more familiar problems in radio receiver design; such as, for example, finding the relationship between inductance capacity and frequency, and working out the design of high frequency transformers. All keen amateurs will appreciate this helpful book.

WIRELESS

DIRECTION FINDING

and DIRECTIONAL RECEPTION

By R. KEEN, B.Eng. (Hons.)

SECOND EDITION (1927)

This volume deals with the principles of the subject and the constructional details of direction finding installations, and includes some information concerning aircraft installation. It describes the principles of Direction and Position Finding in such a way that the subject may be grasped easily by engineers tackling this field of wireless work for the first time. Numerous photographs and diagrams are included, and the book will prove of the utmost use and value to advanced workers who are interested in this aspect of wireless.

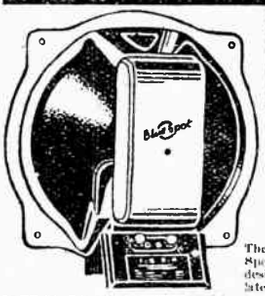
ANOTHER GREAT PURCHASE OF H.M.V. AND OTHER WELL-KNOWN SET MANUFACTURERS' SURPLUS GOODS. TO BE CLEARED AT RIDICULOUS BARGAIN PRICES. All Goods are guaranteed by us.

ELECTRIC LIGHT AND POWER CHECK METERS.—For A.C. Mains 200-250 volts 50 periods. No more wondering as to the amount of current this or that article is using. Here is the check on same. Useful for checking consumption of sub-let flats, charging plants, motors, wireless apparatus or anything using electricity. A few shillings will save pounds. Makers' Westinghouse and other well-known makers. Cost £1/18 each. We are clearing these, in good working order, jewelled pivots, 6/- each, post 1/3. **A.C. HUM** cured by inserting one of these latest design **PHILIPS CHOKES** as used in Philips All-mains Receivers, highest grade nickel iron stamping, special winding, highly impregnated, manufacturers type, 22, 25 and 30 henrys. Owing to the huge number of these which we have purchased, we are giving everyone the benefit of purchasing one of these. Price 2 - each, post free, or 20 - dozen. **BARGAINS IN SETS. MARCONI 4 VALVE SETS (MODEL 44).**—2 S.G., Det. and Power in mahogany cabinets, tuinus valves, 25/6, post 1/6. **MARCONIPHONE 3 VALVE SHORT WAVE RECEIVERS, MODEL 34.**—complete with range of coils 16-29 metres and 29-52 metres and coupling coil, in mahogany cabinet, 25/6, post 1/3. **MARCONI 4 VALVE ALL-MAINS RECEIVERS.**—S.G., Det., L.F. and Power for A.C. mains 200/250 volts 50 periods, Model 520, bargain price, less valves, 52/6. **ROTARY CONVERTERS.**—Electro Dynamic input 220 volts D.C. Output 200/220 volt A.C. 100 watt, complete in fully screened case with hum proof smoothing unit. Perfect condition, listed 12 Gns., to clear, £6/10 - each. **CRYPTO CONVERTERS.**—Input 200/220 volts D.C., output 200 volts A.C., 100 watt complete with starter and hum proof smoother. Price £4/15/-. **CENTRALAB DOUBLE VOLUME CONTROLS.**—Listed 10/6, to clear 2/6, post free. British Radiophone Controls with combined switch 2 -, post 3d. **EVERETT EDGECUMBE 0 TO 3 AMP. MOVING COIL AMPMETERS.**—Reading division of .1 amp., useful for Trickle Charging, etc., 9/6, post 6d. **PHILIPS SPEECH TRANSFORMERS.**—2/-, post 3d. **A.C. ELIMINATORS.**—150 volts 30 m.a., 2 pos. tappings (1 variable), Westinghouse Metal Rectified, for 200-250 volt mains, 28/6, new and guaranteed perfect, post 1/-. **RADIOGRAM CABINETS.**—In Walnut, made for 535 Marconi, felt lined lid with auto-stay, cost makers £8/8/-, a handsome piece of furniture, size 3ft. 6in., height 1ft. 8in., width 1ft. 4in. Price **£2 3 -. REGENTONE ALL-MAINS TABLE CONSOLE CABINETS.**—Polished walnut, size 19in. × 16in. × 10in., beautifully designed, complete with felt lined baffle, 10/6, post 1/-. **COLLARO INDUCTION GRAM. MOTORS.**—(Electric) latest type, complete with automatic stop and all fittings, boxed and unused, £1/17/6, post 1/-. **D.C. ELIMINATORS.**—200/250 volts input, output 150 volts 30 m.a., 2 pos. tappings, 1 variable, all new and guaranteed, 10/6, post 9d. 3 positive tappings and variable, 15 -, post 9d. **WEGO BAKELITE MOULDED CASE CONDENSERS.**—With terminals 700 volt test, 1 m.f. 1 -, post 3d., per doz. 10/-. 2 m.f. 1/9, post 3d., per doz. 18 -. 4 m.f. 2/8 each, 2/3 each in dozens. Postage on dozens 1/3. **MAINS TRANSFORMERS, EKCO.**—All for 200/250 volt input, tapped outputs 350/0/350 volt 80 m.a. 4 v. 4 amp., and 4 v. 2 amp., 10/6, post 1/-. **REGENSTAT ELIMINATOR VOLTAGE CONTROLS.**—Listed 5/6, to clear 1/-, post 3d. **ECKERSLEY TROUTON BALANCED ARMATURE SPEAKERS.**—Complete with 12in. chassis and cone, beautiful reproduction, new and boxed, listed 27/6, to clear 6/11, post 9d. **MAINS RADIO 2 VALVE ALL-MAINS SETS.**—For 200/250 v. A.C. complete with valves and speaker. List 8 Gns., our price 75/-. **LAMPLUGH MOVING COIL SPEAKERS.**—(Silver Ghost) 200/250 v. D.C., listed 27/6, to clear 10 -, all perfect. A.C. Model 22/6, post 1/-. **CONDENSER BANKS, ETC.**—8.25 m.f., T.C.C., tapped 500 v. 2/9, post 3d. 10.5 m.f., T.C.C., tapped 3 -, post 4d. 8.5 m.f., H.M.V., tapped, 2/6, post 1d. 3.6 m.f. Wego, 500 volt tapped 1/9, post 3d. 8 m.f. Siemens 700 v. working, 2/6, post 3d. 4 m.f. Siemens 500 volt, 2 -, post 3d. **FARADEX INTERVALVE TRANSFORMERS.**—2/6, post 6d. **FARADEX MAINS CHOKES.**—2/-, post 3d. **PHILIPS 1 WATT RESISTANCES.**—Full range from 100 ohms up to 100,000 ohms, 6d. each, post free. **COMBINED READING VOLTMETERS.**—0-12 and 0-120 volts, 3/- each, post 6d. **AVOMETERS.**—In good working order, 90/- each. **H.M.V. ALL-MAINS POWER AMPLIFIERS.**—Capable of handling 5 watt without distortion, very heavy components, 100, 200/250 volt A.C. mains. Parts alone worth more than we ask, 62/6, carriage forward. **TO BE CLEARED CHEAP.**—100,000 manufacturers type Edison Bell small fixed condensers, sample box 36 condensers assorted, 1 -, post 3d. **HOUSE TELEPHONES.**—Complete table and desk type, 10/6 each, post 9d. **COLUMBIA 3 VALVE MAINS CABINETS.**—15 × 15 × 10½, 7/6, post 9d. **BRITISH RADIOPHONE 4 GANG VARIABLE CONDENSERS.**—.0005 with Trimmers, 8/6, post 9d. **DUR AMESCO 3 GANG VARIABLE CONDENSERS.**—As used in H.M.V. sets with trimmers. Can be dismantled and used as 2 gang, brand new, 9/6, post 6d. **ELECTRIC CLOCKS FOR A.C. MAINS.**—11in. dial, 27/6. 5in. dial Boudoir type, 25 -. Movements only, 17/6, post 9d. **LARGE CONDENSERS.**—Half micro Farad, 10,000 volt, 10/6 each. **CIFEL D.C. ALL MAINS RECEIVERS.**—Complete with valves and magnavox M.C. speaker, 75/- each brand new. **BATTERY CORDS**—Complete with plugs, 8 and 9 way, 9d., post 3d. **BROWNS METAL ELIMINATOR CASES.**—Size 10½in. × 6in. × 5in., 9d. each., post 6d. **LEAD 1 .044 V.I.R. CABLE.**—5 - per 110 yards coils, post 9d. Lead twin cable 1/.044, 4/- per dozen yards, post 9d. **MAINS DROPPING RESISTANCES.**—592 Ohms 40 watts, reducing from 200/250 volts to 15 volts 1 amp., 2/- each, post free. **BOXES OF ASSORTED SCREWS, B.A.**—(1 Gross in each) always useful, 6d. per gross box., post 3d. **HIGHEST GRADE REISZ PATTERN MICROPHONES.**—In heavy polished octagonal aluminium case, with rings for suspension, even response for amplifiers up to 60 watts. Transformers for all models 5/6 extra, nickeled and oxydised stand for Reisz, 12/6 extra. Price for Microphone, 55/-, post 1/-. **A.C. VOLTMETERS.**—0-150 volts, 4in. dial, price 17/6, post 9d. **A.C. AMP METERS.**—0-50 amps., 15/6, post 6d. **BROADCAST MICROPHONES.**—Pedestal type with rubber suspension, price 15/6. Watch type pattern, very sensitive, 4/6, post 6d. **WE ADVISE EARLY RESPONSE FOR ALL ABOVE GOODS AS SUCH EXCEPTIONAL BARGAINS WILL BE EARLY CLEARED. WE SHALL BE PLEASED TO RECEIVE ENQUIRIES WHICH WILL BE PROMPTLY DEALT WITH.**

SEND ONLY 2/6 FOR ANY OF THE NEWEST "BLUE SPOT" P.M. MOVING COIL LOUDSPEAKERS

FOR 7 DAYS' TRIAL

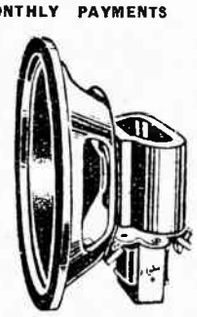
BALANCE BY MONTHLY PAYMENTS



"BLUE SPOT" MODEL 45 P.M., unquestionably a Speaker in a class of its own. Send only 2/6 for 7 days' trial; if satisfied pay further 5/- at once, then six monthly payments of 7/6. (Cash in 7 days, 45/-.)

MAHOGANY CABINET MODEL 62 P.M., incorporating the above chassis, 2/6 deposit, 5/- after 7 days, then nine monthly payments of 7/3. (Cash in 7 days, 67/6.)

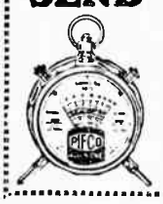
The new "BLUE SPOT" Speakers are of advanced design and embody all the latest refinements. All three new Permanent Magnet Moving-Coil Speakers incorporate Output Transformers with tappings for matching with Power, Pentode and Push-Pull Output. They represent the FINEST VALUE obtainable, therefore take advantage of the 7 DAYS' TRIAL offer and easy monthly terms of E. J. HERAUD, Ltd. Send only 2/6 for either model illustrated for 7 days' trial.



"BLUE SPOT" MODEL 29 P.M., a brilliant Moving-Coil Speaker at a very moderate price. Send only 2/6 for 7 days' trial; if satisfied pay further 5/- at once, then six monthly payments of 5/-. (Cash in 7 days 32/6.)

OAK CABINET MODEL 22 P.M., incorporating the above chassis, 2/6 deposit, 5/- after 7 days, then six monthly payments of 7/6. (Cash in 7 days, 45/-.)

SEND ONLY 1/6



for the famous "PIFCO" ALL-IN-ONE Radiometer

If satisfied, complete purchase by five monthly payments of 2/6. (Cash in 7 days, 12/6). The "Pifco" tests everything—valves, components, circuit, etc., and locates faults instantly. It is essential to every radio user and helps to keep any set in 100% condition.

"LET'S HAVE A MAN'S COMPONENT TO OUR OWN SPECIFICATION"

"I notice that several of the Sets described in the Radio Press specify DAVENSET Chokes and Transformers. If they are good enough for the experts they are certainly good enough for me. And besides, I notice that Davenset Engineers specialise in making to individual specification. Let's tell them what we want."

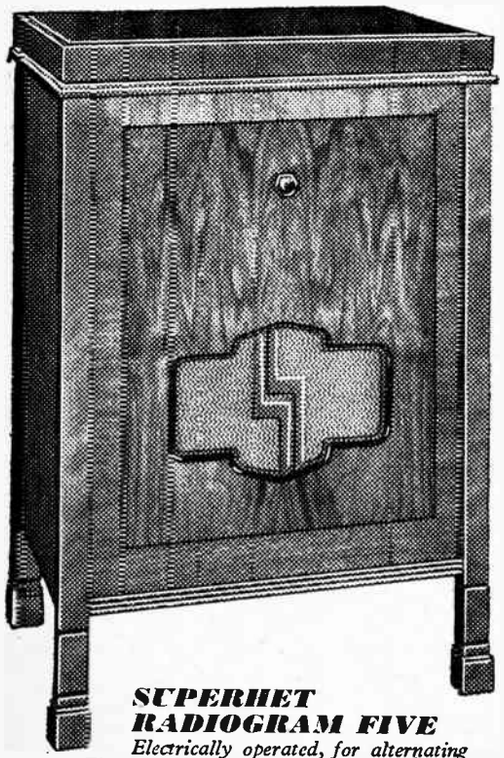
SUPERHET SELECTIVE FIVE

Electrically operated, for alternating current, in compact acoustically designed cabinet of figured walnut on ebonised base. Superheterodyne circuit with band-pass tuning. Separated illuminated wavelength scales with names of principal stations. Self-contained aerial device. Five Marconi valves, (inc. rectifier). Variable mu I.F. amplifier. Energised moving coil speaker of new type. MODEL 438.

Price 15 Gns. *Or by Hire Purchase.*



SUPERHET RADIOGRAM FIVE

Electrically operated, for alternating current. Five Marconi valves (inc. rectifier). Variable mu I.F. amplifier. New type moving coil speaker. Superheterodyne circuit with band-pass tuning. Separate illuminated wavelength scales on motor board, with names of principal stations. Self-contained aerial device. Beautiful pedestal cabinet in finely figured walnut. MODEL 512.

Price 29 Gns. *Or by Hire Purchase.*

IN CHOOSING RADIO TO-DAY, from so wide and ever-growing a field of choice, the wise listener places his confidence in a name or a trademark with a reputation to keep up. "HIS MASTER'S VOICE" is the most famous trademark in the world—and all the world knows its meaning. The little dog pricks up his ears and cocks his head sideways because he thinks he hears his master speaking. For thirty years "HIS MASTER'S VOICE" have kept to this ideal—an ideal of the reproduction of sound so real as to be indistinguishable from life. And still to-day, the test of "HIS MASTER'S VOICE" Radio is to LISTEN . . . just listen! By that test you will appreciate the difference — the difference that really matters — between "HIS MASTER'S VOICE" Radio and other sets.

You are invited to apply this test to any of the "HIS MASTER'S VOICE" instruments, and full particulars of the complete range can be obtained from any authorised dealer, or from "His Master's Voice," 98a, Clerkenwell Road, London, E.C.1.

EDITORIAL COMMENT

The Art of Listening

Advantages of Indirect Reception

ONCE again broadcast listeners and, in particular, the musicians amongst them, have provoked a discussion on the comparative merits of direct and indirect listening, in the concert hall itself, or through the medium of a broadcast receiver.

On this occasion it is *The Times* which provides the forum, and that eminent musician, Sir Walford Davies, who has endeared himself to all wireless listeners, is responsible for what must be regarded, amongst all the rest, as the most provocative contribution to the discussion.

Disregarding all the limitations, such as frequency response and monaural reception, of which broadcasting engineers are so painfully conscious, Sir Walford boldly states: "Personally I have never in my life enjoyed Beethoven more in any concert room here or abroad than I have enjoyed him 'electrically reproduced' recently."

We suggest that one of the reasons why a musician can claim to get more enjoyment out of electrically reproduced music than from direct listening may be attributable to the fact that in the concert hall it is difficult to give full attention to the music without being distracted by the sense of sight and by the little interferences and interruptions to absorption in the music which go on all round. In listening through the medium of the broadcast receiver it is possible to suppress all extraneous noises and interruptions and, if necessary, put out the lights as well, to remove the disturbing influence of the sense of sight.

If we weigh in the balance the advantages of broadcast listening against the disadvantages, we think it quite likely that even a jury composed entirely of musicians might give a verdict in favour of broadcast reception, for the reason that, great as are the merits of direct listening from such points of view as quality and the ability to locate sound because we are listening binaurally, the advantages on the side of listening without any distracting noises are greater.

Faults to Correct

There are two important considerations which militate against satisfactory listening through the medium of a broadcast receiver. The first is that we are still in the position that an enormous proportion of the listeners employ sets which are incapable of reproducing music at a high standard of faithfulness. Secondly, the art of listening has been very poorly developed. Undivided attention is rarely given to a musical broadcast; yet what should we think if in a concert hall the audience provided themselves with novels to read meanwhile, or engaged in conversation with their neighbours?

Fortunately, the remedy for both these objections to our present standard of listening is in the hands of the listener himself; he must learn to understand his set and to judge whether its performance is doing justice to the original transmission, and he must acquire the art of listening before he can begin to judge the relative merits of direct and indirect performance. All this surely leads us to the view that the public should be educated to an appreciation of the capabilities of the modern high quality receiver, and once more we would recommend that the radio industry should install high grade broadcast receivers in suitable places throughout the country for public listening.

Delayed Diode A.V.C.

Selecting the Best Operating Conditions

By W. T. COCKING

THE various methods by which automatic volume control can be achieved are by now fairly well understood, and it is generally realised that if the initial sensitivity of the receiver is not to be reduced the control should be delayed—that is, it should be inoperative until the signal input exceeds a certain predetermined value. Although there is no mystery about the manner in which circuits of this type function, there are so many different arrangements with which A.V.C. can be obtained that a choice is sometimes difficult. Moreover, having selected the system which is to be used, the problem of choosing the best operating conditions still remains.

The delayed diode A.V.C. circuit is attractive on account of its simplicity, and, although it may not be the best in all circumstances for A.C. operated sets, it remains probably the only entirely satisfactory arrangement which can be used in D.C. mains and battery-operated receivers on account of the limitation in the supply voltage in these cases. For the moment, therefore, let us confine our attention to this system and examine its characteristics in some detail, particularly with regard to the determination of the correct delay voltage.

In Fig. 1 will be seen the fundamental circuit of the delayed diode A.V.C. system in which the valve is shown as a simple duo-diode type, although it may equally well be one of the combination duo-diode-triode or duo-diode-pentode types, or even two separate triodes connected as diodes or two Westectors. The H.F. or I.F. input is applied from the tuned circuit to the diode anode A1, the cathode connection being completed through the load resistance R1. In this circuit, therefore, normal signal rectification takes place, and the L.F. voltages are developed across R1 and transferred through the H.F. filter and manual volume control to the next valve. The H.F. input is also applied through the small condenser C1 to the other diode anode A2, which is connected to the cathode through the resistances R3 and R4. R3 is the diode load resistance, and usually has a value in the neighbourhood of 0.5 MΩ, while R4, with R5, forms part of a potentiometer across the H.T. supply. The cathode, therefore, is biased positively with respect to the earth line, and, as a result, the anode A2 is biased negatively with respect to its cathode.

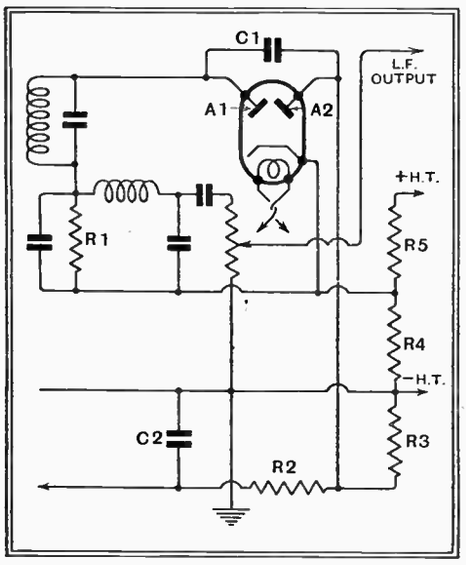

Fig. 1.—The fundamental circuit of the delayed diode A.V.C. system. The control grids of the H.F. valves derive their bias through the resistance R2.

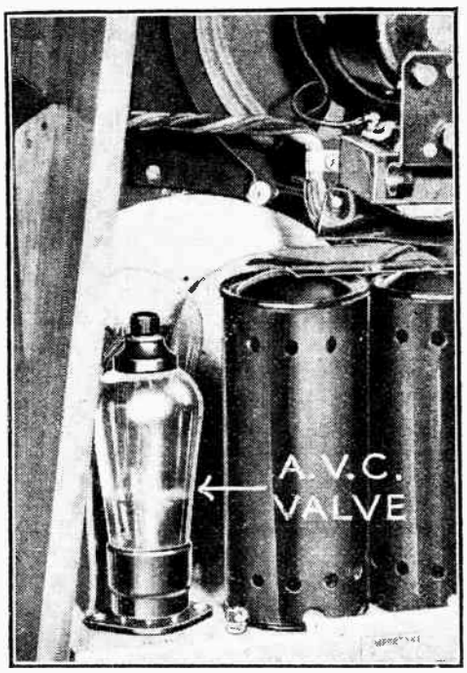

The double-diode valve is usually of the duo-diode-triode type, and in addition to acting as the second detector and providing delayed A.V.C. it gives a first stage of L.F. amplification. The illustration is from the Ferranti Gloria superheterodyne.

The success or otherwise of the A.V.C. system depends very largely upon the amount of this bias, which is usually known as the delay voltage. Until the signal input to the anode A2 exceeds the delay voltage no rectification occurs in this circuit, and A.V.C. is inoperative. Obviously, therefore, the delay voltage should equal the detector input obtained from the weakest signal it is desired to receive. On the other hand, if A.V.C. is to be so effective that on the strongest signal the output to the ear is not appreciably louder, the detector input must not rise to more than twice the small input figure, for this corresponds to a change of output of only 6 DB. For this result to be achieved the delay voltage must be equal to the maximum bias required by the H.F. or I.F. stages, and this, in turn, will depend upon the type of H.F. valves employed and upon the number of controlled stages.

A little thought will soon show that in the general case this will lead to the detector being operated at a very large signal input, and this will mean the use of many H.F. stages and but little L.F. amplification. Whether or not this is satisfactory will depend upon many factors, of which cost is by no means unimportant.

Choosing the Delay Voltage

To put the question upon a practical basis, let us consider the choice of delay voltage for a two H.F. receiver, and let us assume that we wish A.V.C. to commence when the input to the first H.F. valve is 1 millivolt, and that the output must not rise by more than 6 DB when the input is 5 volts. These figures for input correspond roughly to the reception of a moderately strong foreign station and the local station respectively. For an output ratio of 2-1, or 6 DB, therefore, the input will vary in the ratio 5,000-1, or 74 DB.

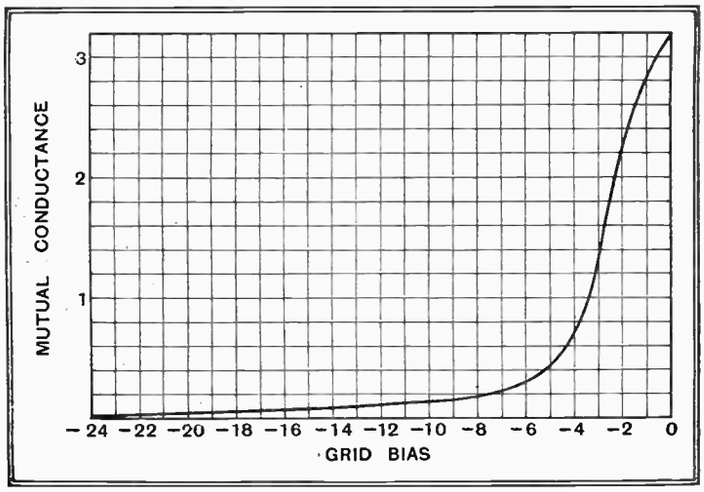

Fig. 2.—The mutual conductance of the V.P.4 valve for any bias voltage can be read off from this curve.

Let us suppose that we are using Mullard V.P.4 type H.F. pentodes with an anode supply of 200 volts, and the screens held at 100 volts, the initial bias being −1.5 volts. The curve of mutual conductance with grid bias is shown in Fig. 2. Now in

Delayed Diode A.V.C.—

the majority of practical cases, an H.F. valve is operated with a load impedance of quite small value compared with its internal A.C. resistance, and the stage gain is then equal to the product of the mutual conductance and the load impedance when both are expressed in suitable units. Since the amplification per stage is proportional to the mutual conductance, therefore, we can for our present purposes ignore it and work directly in terms of mutual conductance. As it is much easier

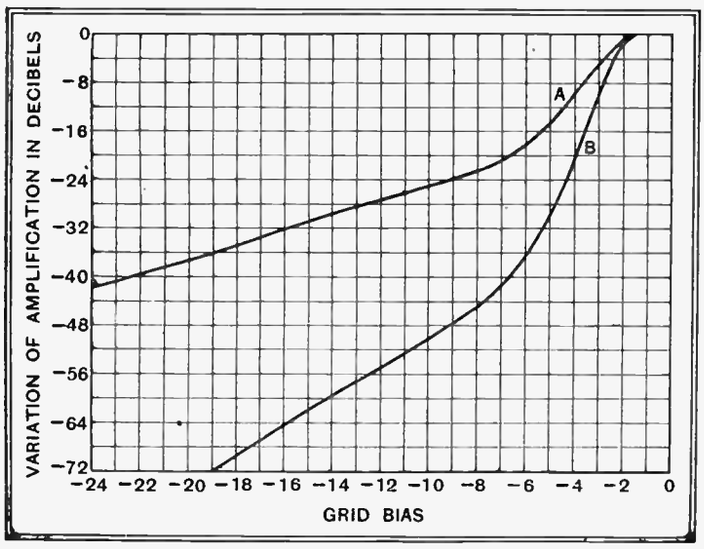

Fig. 3.—The variation of amplification with bias for one (A) and two (B) H.F. stages is shown here.

to work in terms of decibels than voltage ratios, let us convert the curve of Fig. 2 into one showing the drop in amplification resulting from the application of grid bias to a single valve. This is shown in Fig. 3 for one stage, curve A, and for two stages, curve B, and from this we can directly determine the bias required.

Since the signal input varies by 74 DB, and we permit an output variation of 6 DB, the amplification must vary by the difference, or 68 DB. Curve B of Fig. 3 shows that with two controlled stages the amplification drops 68 DB when the bias is – 17.5 volts as compared with the initial bias of – 1.5 volts. If we assume that this latter is fixed, and does not change with the H.F. valves' anode current, we need a change of bias of 16 volts. This will not be the case when the H.F. valves' bias is derived from a cathode resistance, and then some 17 to 17.5 volts A.V.C. bias will be needed.

The H.F. and L.F. Stages

For a bias change of 16 volts the delay voltage must equal the bias voltage and also be 16 volts. The A.V.C. system will then come into action when the detector input is 16 volts peak, assuming 100 per cent. rectification efficiency, and will be 32 volts peak when the output has risen by 6 DB and the input to the first valve by 74 DB. The rectification efficiency, however, is, in practice, more nearly 85 per cent. than 100 per cent., so that the actual maximum and minimum figures for the detector input will be nearer 37.6 and 18.8 volts peak, or, say, 38 and 19 volts. From the data given it is quite easy to plot the A.V.C. curve of the set, and this is shown in Fig. 4; it is usually unnecessary to do so, however.

The design of the A.V.C. circuit itself thus involves no difficulty; we have now to see, however, how these detector operating conditions will fit in with the rest of the receiver. In the first place, we see that on the weakest worth-while signal, on which A.V.C. just begins to operate, we have a detector input of 19 volts peak. This gives us a D.C. potential across the detector load (R1 of Fig. 1) of about 16 volts, and for 80 per cent. modulation we shall have an L.F. potential of 12.8 volts peak. This is just sufficient slightly to overload a normal pentode-type output valve with resistance-capacity coupling, but if we wish to use a triode we shall have to use a low-gain L.F. stage preceding it, for a transformer coupling does not fit nicely after a diode. In the L.F. circuits, therefore, there is no special difficulty provided that we use a pentode output valve.

Let us now consider the H.F. circuits. The detector input for a strong signal is 38 volts peak, but during 80 per cent. modulation it will rise to a maximum of about 68 volts. The preceding H.F. or I.F. stage, therefore, must be designed to give this output without distortion. When using an ordinary variable-mu valve such an output can hardly be obtained without distortion when the valve is biased for local reception, and the stage preceding the diode cannot, therefore, be controlled. This, in turn, involves the use of three H.F. stages, for it would not be possible to obtain the requisite range of control with only a single controlled stage. With an H.F. pentode, however, it should be just possible to obtain the necessary output without distortion, so that we can then control the stage preceding the diode and so save an H.F. amplifier, unless this should be needed for amplification purposes. The intervalve coupling is not without importance, however, for in the foregoing it has been assumed that it is of the single tuned circuit type. If a band-pass filter be used, as in many superheterodynes, the valve preceding the detector must be designed to give a distortionless output of at least twice the maximum detector input required, or, in this case, 136 volts peak. This obviously leads to serious difficulties with this method of A.V.C.

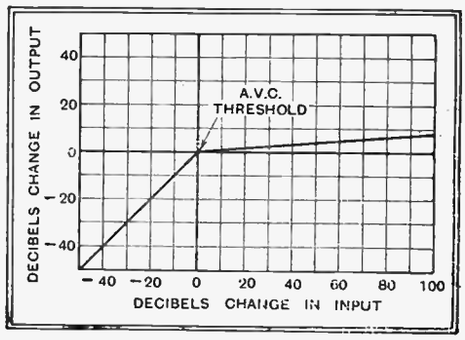

Fig. 4.—The A.V.C. curve for the conditions laid down in the text takes the form illustrated. For signals stronger than the delay voltage, a change of input of 100 D.B. affects the output by only 9 D.B.

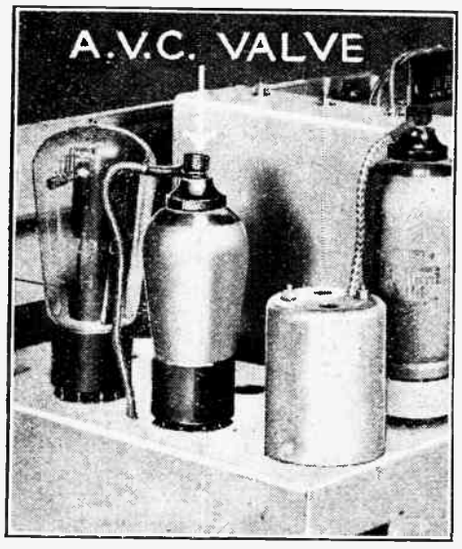
H.F. Stage Gain

Let us now see whether we can obtain from two stages the degree of amplification which has hitherto been implicitly assumed. The minimum detector input is 19 volts peak, or 13.4 volts R.M.S., and the input to the first valve is :: millivolt. The amplification required, therefore, is 13,400 times, so that the stage gain of each valve must be 116 times for a total of two H.F. stages. Now the amplification per stage is roughly equal to the mutual conductance in mA/V. multiplied by the load impedance of the valve in thousands of ohms. The mutual conductance at minimum bias is 2.4 mA/V., so for a stage gain of 116 times the load resistance must be 48,400 ohms, or, say, 50,000 ohms. This is by no means an abnormally high figure, for even air-cored coils of the small screened type rarely have a dynamic resistance lower than this.

In theory, therefore, there is no difficulty in meeting the requirements which we have assumed. In practice, however, we may find it difficult to obtain the requisite H.F. amplification. It is a common experience that two H.F. stages with air-cored coils are unstable unless the anode connections to the coils are tapped well down, or unless unusually effective screening is adopted. It is a matter of considerable difficulty to obtain an amplification



In the duo-diode-triode valve, often employed to give delayed diode A.V.C., the terminal on the top of the bulb is for the triode control grid. (Ekco Model 74 Superheterodyne.)

Delayed Diode A.V.C.—

per stage as great as 116 times when two stages are employed without meeting instability problems. It is by no means difficult to obtain this amplification from a single stage, but with two stages it is another story.

It is usually more satisfactory, therefore, to adopt an A.V.C. circuit which does not call for such a large detector input, for then we can use a smaller degree of H.F. amplification and make up for the reduced sensitivity by increasing the L.F. amplification, and in the long run this will often prove the cheaper course. In the case of a superheterodyne, however, this does not necessarily apply, for it is by no means impossible to obtain an amplification much greater than 116 times from a single I.F. stage, and the remaining amplification may be given by the first detector or an H.F. stage. Since the amplification in the different stages is obtained at different frequencies, instability problems rarely arise.

Battery and D.C. Sets

In the case of battery and D.C. mains sets there is no real alternative to the delayed diode A.V.C. system for the reason that other methods require a source of voltage additional to the normal H.T. supply for their operation, and this is not usually obtainable in a convenient manner. In an A.C. set additional voltages present little difficulty, and we can employ amplified delayed A.V.C. or delayed square law A.V.C.

It should be pointed out, however, that the difficulties attendant upon the use of delayed diode A.V.C. are greatly reduced if the circuit is designed to give a lesser degree of perfection. If no account be taken of the local station, and the system be designed to give a substantially level output on the weakest to the strongest of distant stations, it will still counteract fading, and a much smaller delay voltage can be used with a consequent reduction in the normal detector input. This will ease the design of the H.F. circuits and permit a more normal value of L.F. amplification to be used. In order to permit undistorted local reception, however, a local-distance switch must be fitted.

There is, however, a modification of delayed diode A.V.C. which considerably reduces the difficulties attendant upon its use. This is when the control is not confined to the pre-detector stages, but is arranged to operate also upon a variable-mu L.F. valve. It is then unnecessary to restrict the detector input variations to a 2-1 ratio to obtain good A.V.C., and a very much wider range is permissible. This in turn means that a lower delay voltage can be used with less detector input.

It will be seen, therefore, that the delayed diode A.V.C. system is not necessarily the best, but it has been selected here for description because it is the fundamental circuit upon which most other methods are based, and because the methods of design which have been adopted are capable of simple extension to cover many other circuits. It is hoped to deal with these other arrangements in a further article.

DISTANT RECEPTION NOTES

Progress on American 500 kW. Station

WORK on WLW's new 500-kilowatt transmitter at Cincinnati, Ohio, is, I hear, proceeding rapidly. The great 800-foot mast which is to form the vertical aerial is now nearly completed, and it is being used at times for tests with the old transmitter. Since American stations continue to come in well, any reader who is using his set in the small hours may find it worth while to tune to 428.3 metres (700 kilocycles) in search of WLW. During the last twelve months transatlantic stations with wavelengths above about 350 metres have not been too well received, but if history repeats itself stations on higher wavelengths should be well heard during the coming autumn and winter.

During the present month the new 20-kilowatt Lisbon transmitter is due to come into action. Tests may begin at any time now, and the wavelength will probably be that of the present Lisbon station, 282.2 metres (1,063 kilocycles). This will be a Government station, the first of a chain to serve the whole of Portugal. The Lisbon programmes will be relayed for the Portuguese Colonies as heretofore by the short-wave transmitter CT1AA on 31.25 metres. There is a possibility that the aerial power of the short-wave station may be increased to some extent.

Beromünster is showing extraordinary strength at the present time, and I have frequently obtained reception from this station at full loud-speaker strength during daylight hours. Other "daylight" stations on the medium waves are Brussels No. 1 and No. 2, Langenburg, Hilversum (Huizen programmes), Prague, Leipzig, Breslau, Poste Parisien, Fécamp, Trieste, with occasionally Strasbourg, Rome and Heilsberg.

Oslo is now usually quite clear of interference, though both the Eiffel Tower and Warsaw are occasionally jammed. There is a small amount of fading on the medium waveband, particularly amongst stations with wavelengths above 450 metres.

Heterodyne interference is not serious at the present time on the medium waveband. The only important stations that have been at all affected are Bari, Turin, and Florence. With the increase in all-round field strength that must occur during the next few weeks rather more heterodynes are to be expected, and it is quite possible that on this account the number of stations receivable free from interference may be smaller during the darker months than it was during the summer—a complete reversal of the old ideas about long-distance wireless reception!

I am still at a complete loss to account for the behaviour of Brno. For perhaps half a dozen months on end we hear absolutely nothing of this station, and then comes a night when Brno is received as strongly and as well as, say, Toulouse. One could understand it if the station were heard fairly well on some nights and very well on others, but the sudden change from complete silence to very big signal strength is puzzling. It is interesting to note that the other big Czechoslovakian station, Bratislava, is also remarkable for intermittent reception. In this case, though, the "good" nights are much more frequent, and I do sometimes hear the station rather feebly.

Motala is now amongst the best of the long-wave stations, other excellent transmissions being Oslo, Luxembourg, Zeesen, and Radio-Paris. In addition to those mentioned as providing daylight reception, the pick of the medium-wave stations are Toulouse, Milan, Göteborg, Nürnberg and Katowice.

MODERN MODES IN AMERICA. This scene at KYW, the broadcasting station in the heart of the great Chicago Exposition, typifies the modern trend in studio fittings and furniture. The announcer's desk is close to the Control window.

Simple Measurements on Receivers and Components

By S. O. PEARSON, B.Sc., A.M.I.E.E.

MANY practical tests on receivers are suggested in this article, which should be read in conjunction with the contribution on the same subject which appeared in last week's issue

Finding Faults and Checking Voltages

WHEN the construction of a new receiver is completed it is always advisable to test the circuits before the high-tension voltages are applied to the valves, for an unexpected short circuit can account for a considerable amount of damage in a fraction of a second. This applies more to battery-operated sets and D.C. mains sets than to mains-operated A.C. receivers. One reason is that the filaments of D.C. valves are more delicate than the heater elements of A.C. indirectly heated valves, the fusing current being smaller for the former. The other, and perhaps more important, reason is that a short-circuited H.T. battery, or D.C. mains, gives a far greater current than that obtained from an A.C. eliminator when the output terminals are short-circuited. This is because the internal resistance of an A.C. eliminator and its associated smoothing circuits is comparatively high, and acts as an effective current limiter.

Damage to valve filaments occurs if the high-tension supply is short-circuited in such a way that the current passes through the valve filaments. In the case of a battery-operated set the negative H.T. terminal is connected to the negative end of the filaments, and therefore if the positive H.T. terminal should accidentally make contact with the wire joining the positive ends of the filaments, the short-circuit current would pass through the latter and burn them out, should the L.T. current be switched off. This is made clear by Fig. 1, in which the dotted line connection represents the unwanted path between H.T. + and L.T. +, which may be due to an error in wiring, a fault in an intervalve component, or an unsuspected contact between a positive H.T. lead and a positive L.T. lead. The arrows indicate the path of the short-circuit current. With the L.T. circuit closed, the short-circuit current would pass mostly through the accumulator, and the valves would probably not suffer. But the H.T. battery would.

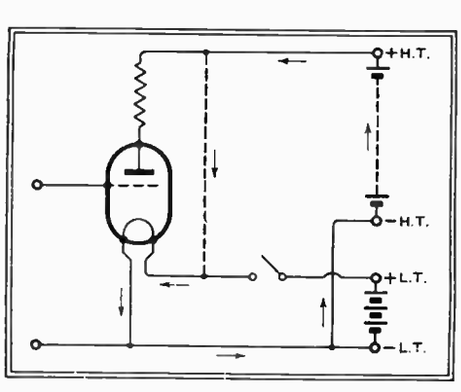

Fig. 1.—How an accidental short circuit between H.T. + and L.T. + leads may result in a burnt-out filament.

It would be interesting to know how many unfortunate ones have had all their valves burnt out through this particular fault! The short-circuit current from an A.C. eliminator would most likely not be sufficiently large to burn out several valve filaments, connected in parallel as they are in an ordinary receiver.

Testing for Short Circuits

In a battery-operated set one does not find a potential divider connected between H.T. + and H.T. − for the purpose of obtaining an intermediate voltage for screen potentials of H.F. valves; the necessary voltage is taken from a tapping on the H.T. battery. Consequently, the only current coming from the battery under normal conditions is the sum of the anode currents of all valves, from the main positive terminal, and the screen currents of S.G. or variable-mu valves from a tapping point. *These currents can only flow when the filaments are heated* So, with the filament battery disconnected altogether, one of the first tests to make is to ascertain that no current flows in the H.T. circuits. The correct procedure is to connect a *voltmeter* (or the highest *voltage* range of a composite instrument) in the negative lead from the H.T. battery, with all valves in their sockets, as shown in Fig. 2, which is a skeleton diagram giving the normal conducting circuits between the H.T. battery and the electrodes of the valves. A milliammeter could be used instead of a voltmeter if a few thousand ohms resistance is connected in series for protective purposes, as explained in Part I of this article.

If the meter gives a reading there is something wrong, and the seat of the trouble must be searched for systematically by a process of elimination. The fault may be in the wiring or in one of the intervalve components; but it is just possible that there may be an internal short circuit in one of the valves themselves. To test for the latter the valves must be withdrawn from their sockets one at a time, and if the meter reading disappears when one of the valves is taken out of its holder, that particular valve is at fault and must be discarded.

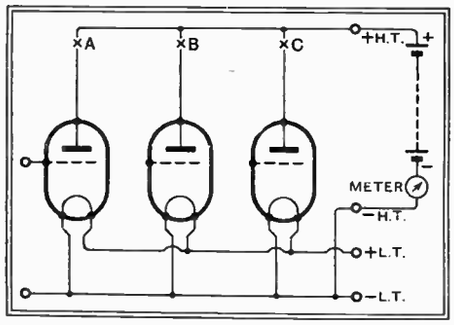

Fig. 2.—Skeleton diagram of a receiver, showing the normal conducting circuits between the H.T. battery and the electrodes of the valves.

If the meter continues to read after all the valves have been removed, there is a short circuit somewhere in the wiring, and the next step is to locate it. The meter should be removed from the negative H.T. lead and connected in turn in the branch leads to the individual anode circuits of the valves, the safety resistance always being included when a milliammeter is used. The correct places are where these leads branch off from the

Simple Measurements on Receivers

main H.T. busbar, as marked at A, B, and C in Fig. 2: that is, between the H.T. supply lead and the corresponding components in each anode circuit. Temporary disconnections will have to be made to include the meter. The valves need not be replaced during this test.

If current is found to flow in one of these anode circuits, the discovery of the fault is near at hand, and there are several likely spots to search. Among possible causes are: (*a*) A faulty decoupling condenser (see Fig. 3); (*b*) electrical connection between primary and secondary windings of an intervalve transformer, or between primary winding and an earthed core; (*c*) a faulty blocking condenser used in conjunction with a parallel-fed transformer or a tuned-grid high-frequency coupling; (*d*) a faulty reaction condenser. The path of the short-circuit current is indicated in each case by the heavy lines in Fig. 3. If all these components are in order, it is possible that a short circuit may exist in the corresponding valve holder itself. However, the process of elimination is continued until the fault is found.

Should the individual anode circuits and the screen-grid circuit prove to be in order, there must be a direct connection somewhere between the positive H.T. busbar and "earth." Examine carefully for wires which may have got bent out of position and come into contact with another wire or the metal chassis. The voltmeter should finally be connected across the loud speaker terminals to ascertain that no direct current flows there.

The same tests can be applied to an A.C. receiver, but it must be remembered that there will most likely be at least one potential divider circuit, which must be opened temporarily during the tests, and *the heaters must be switched off*. The A.C. eliminator should not be used for supplying the testing voltage because, if there is a short circuit in the set, the rectifying valve will be damaged. It is better to use a battery of a few volts connected between the H.T. positive and negative terminals of the set. If the eliminator is built in with the set a temporary disconnection can be made.

Checking Voltages in a Receiver

When it has been ascertained beyond all doubt that there are no faults in the circuits of the receiver, the H.T. and L.T. voltages can be applied with safety. Of course, where grid bias voltages are obtained from a battery, it is essential to see that the latter, after having been tested with the voltmeter, is connected into the circuit before the H.T. and L.T. voltages are applied. If it is a battery-operated set, the voltage of the H.T. battery should also be checked with the voltmeter, but the accumulator supplying the filaments can be relied upon to give the correct voltage if it is in good condition and has been recently charged.

Where the H.T. supply is obtained from an A.C. eliminator the checking of the voltage at the terminals is not so straightforward. There are two main reasons for this, the first being that, owing to the internal resistance of the eliminator, the voltage depends to a large extent on the current supplied to the set, unless a neon stabiliser is connected across the terminals. So the voltage of the eliminator must be measured when it is supplying the normal current. Now, an ordinary voltmeter usually consumes several milliamperes; in fact, it may take as much current as the complete set; and so, if an attempt is made to measure the voltage when the set is being supplied with current, an extra load is put on the eliminator and a false reading is obtained. An electrostatic voltmeter, which takes no current, or a very high-resistance voltmeter would, of course, give satisfactory readings.

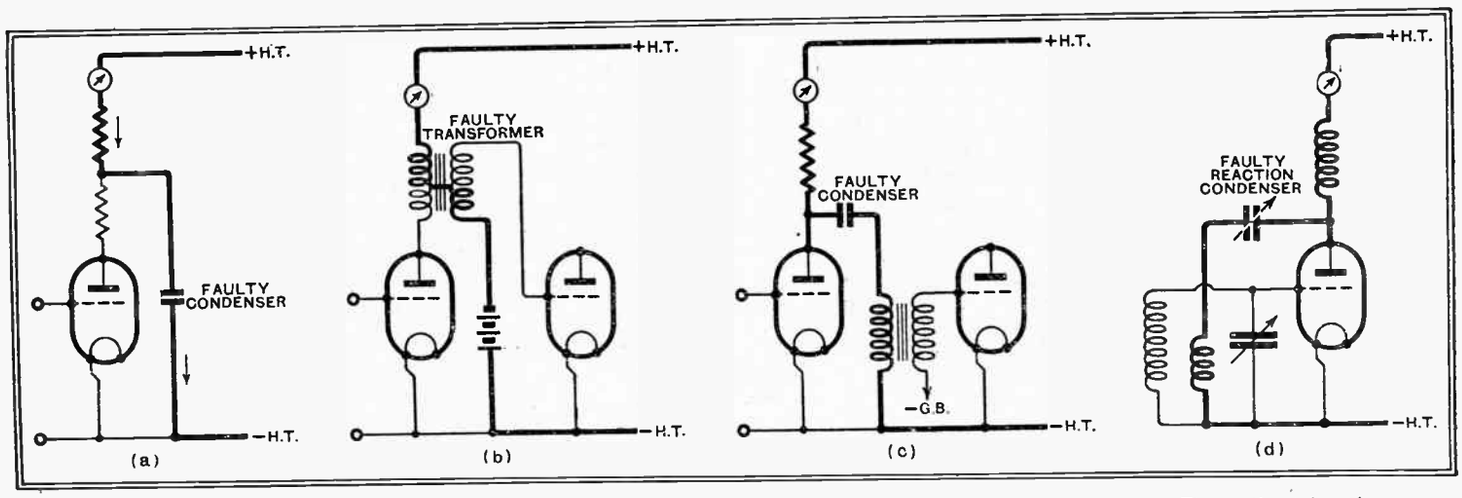

Fig. 3.—Diagram showing how some faulty components are responsible for short circuit or leakage currents. The paths taken by these currents are indicated by the heavy lines.

To obtain the actual operating voltage of the eliminator with the use of an ordinary voltmeter, the best procedure is to obtain a regulation curve of terminal volts, plotted against output current, and this involves the use of a separate milliammeter, and requires some means of varying the output current. A device for the latter purpose can conveniently be improvised by using the power output valve of the set; it can be made to take different anode currents by varying the grid bias obtained from a battery. The circuit arrangement of Fig. 4 (a) shows clearly how the calibration is made. The milliammeter must be connected on the eliminator side of the voltmeter so as to register the sum of the currents taken by the valve and the voltmeter. The lowest current reading would be that obtained without connection being made to the valve anode, being the current taken by the voltmeter alone; then other readings are taken with the valve in circuit and with various negative voltages applied to the grid. When changing the tapping point on the bias battery, it is absolutely essential to switch off the H.T. first, otherwise the valve will take excessive current in the anode circuit as soon as the grid is disconnected from the battery, and damage may result. The curve obtained will be more or less a straight line, as in Fig. 4 (b), so only three or four points need be found. With this regulation curve available the

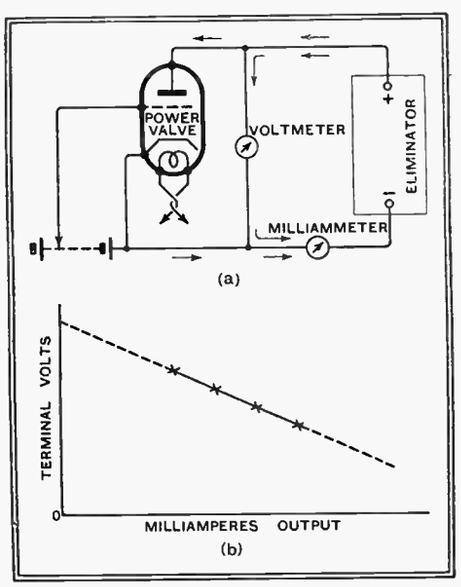

Fig. 4.—(a) How the regulation curve of an eliminator can be found by using a power valve as the variable part of the load. (b) The form of the regulation curve.

Simple Measurements on Receivers

eliminator voltage is known for any output current.

The correct anode current of each valve in the set can be computed fairly closely from the characteristics of the valves used, and these currents are usually stated in constructional articles on specific receivers. So the total current to be supplied by the H.T. battery or eliminator is easily estimated. It is impossible to measure directly the voltages at the anodes, grids, and screens of valves with an ordinary voltmeter, because the resistance of the latter is usually smaller than the resistances of the components in the circuits leading to various electrodes. But if each valve is found to take an anode current approximately equal to the estimated value, it is usually safe to assume that the operating voltages are correct.

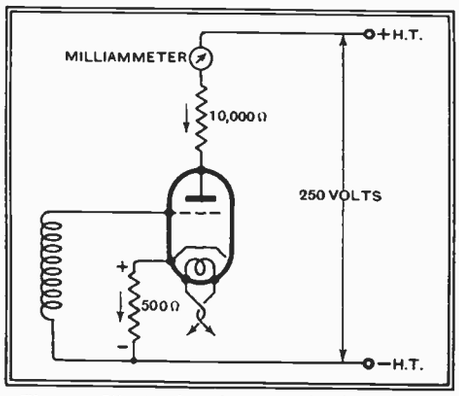

Fig. 5.—Illustrating the example given in the text of finding the anode potential and grid bias voltage.

The first test to make when the supply voltages are applied to the set is to see that the total H.T. current taken is approximately correct, by connecting the milliammeter in one of the leads from the H.T. battery or eliminator. An excessive current may indicate little or no bias voltage at the grid of one of the more powerful valves, such as the output valve. In this event the set must be switched off immediately, and investigations made by examining grid circuits. A bad fault is usually easy to find.

Checking Anode Current

It is more usual to find that the total anode current differs from the normal value by a few per cent. only, but if the discrepancy is greater than 25 or 30 per cent. it is worth while checking the currents in the individual anode circuits, to discover which one is incorrect. Naturally the power valve takes the greatest current and should be checked first. Excessive anode current almost certainly indicates a wrong grid bias voltage, and if the set is provided with "automatic" bias the particular bias resistance must be suspected. To ascertain if this is the seat of the trouble the correct bias voltage could be obtained temporarily from a battery. If the anode current is then correct the trouble has been located, the automatic bias resistance being too low; maybe part or all of it is short-circuited. A faulty decoupling condenser would have this effect!

Another very feasible cause of excessive anode current is the breakdown of the blocking condenser used in choke-capacity or resistance-capacity coupling between the grid of the valve in question and the anode of the previous valve. A breakdown of this condenser results in a high positive potential being applied to the grid of the valve; this state of affairs is very serious, because the grid and anode are now virtually in parallel and carry the greatest current the valve is capable of passing. In these circumstances the cathode would be very quickly ruined.

Insufficient anode current would either mean excessive negative grid bias or low emission of the valve filament (or cathode). If the anode current does not increase appreciably when the grid bias is reduced in value it can be assumed that the valve cathode is incapable of giving greater emission. There may be one of two reasons for this: (a) either the filament or heater voltage is below normal, or (b) the valve is getting old and the emission falling off. The cure in either case is obvious.

Finding Anode and Grid Voltages

The actual voltage between the anode and cathode of a valve can only be measured directly with an electrostatic voltmeter, a rather costly instrument; but if the resistance of the external anode circuit is known the current can be measured with a milliammeter and the voltage calculated. In the same way grid bias voltage obtained from a resistance in the cathode circuit can be found.

Let us take as an example an A.C. indirectly heated valve, with 10,000 ohms in the anode circuit and 500 ohms in the cathode lead, as in Fig. 5. The milliammeter is connected either in the cathode lead or the anode lead for a triode. Suppose that the current is found to be 6 milliamperes, and that the eliminator gives 250 volts at the terminals. The voltage drop in the anode resistance is $0.006 \times 10{,}000 = 60$ volts, and in the 500 ohm bias resistance it is $0.006 \times 500 = 3$ volts. The total voltage drop in the external resistances is therefore 63, and so the voltage between the anode and cathode of the valve is $250 - 63 = 187$ volts. The cathode is 3 volts positive with respect to the grid, and so the grid bias is -3 volts.

In the case of a screen-grid valve the bias resistance carries the sum of the anode and screen currents, so in finding the grid bias the milliammeter must be connected in the cathode lead. To find the anode-to-cathode voltage, calculate separately the voltage drop in the anode resistance and in the bias resistance from the individual currents measured in each. Subtracting the sum of these voltages from the eliminator voltage gives the anode potential with respect to the cathode.

The few examples that have been given here should serve to show how useful one or two meters can be. All the tests described for a newly constructed receiver can equally well be applied to one already in use, and faults may be traced with a minimum of trouble and expense. Many other uses will suggest themselves, not only in tracing faults, etc., but in connection with the operation of the receiver. For instance, a milliammeter in the detector anode circuit enables accurate tuning to be effected visually; and a milliammeter in the anode circuit of any L.F. amplifier valve or the output valve enables one to detect overloading.

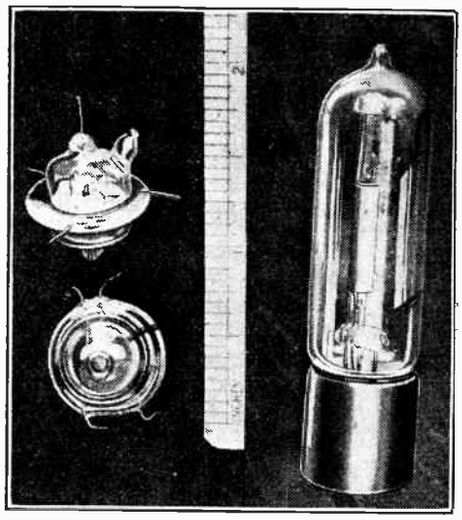
Short Wave Valves

Development of Minute Types

NEW work on the development of valves for use at wavelengths below one metre has recently been described in America.

Disregarding the generally accepted idea that to get oscillations and amplification at lower wavelengths required trick circuits with conventional valves, it was decided instead to remake the valves and use them with conventional circuits. This has now been done experimentally; to make valves work at wavelengths ten times as low as present valves, the dimensions of the valves were reduced by a factor of ten. Reducing the physical dimensions did not change the characteristics, but the inter-electrode capacities were reduced and the limiting wavelength could be taken down much lower. Designers have been successful in making valves which oscillate beautifully at 100 centimetres in well-known circuits and which oscillate without difficulty, though with less power, at 40 centimetres.

Not only will these valves oscillate—they will amplify. Thus at 100 centimetres a stage gain of about 4 with a screen grid valve is not difficult.



Two of the new valves (approximately actual size) are shown on the left. The valve on the right is a Weco peanut for comparison.

It sounds simple to reduce the dimensions of a valve by a factor of ten, but the problems are many. According to one correspondent the point has not been reached where these diminutive valves can be made in quantity. The tolerances between elements are so small that slight changes in geometry produce large changes in electrical characteristics. But good progress has been made: new valves working well at one metre and less have been made—and television seems nearer. For it is certain that television must go on the ultra-short wavelengths, certainly of the order of 5 metres.

News of the Week

Current Events in Brief Review

There's a Reason

NO fewer than 30,000 Austrian wireless users have refused to pay radio licence fees for "political reasons."

Here and There

THE Berlin Radio Show, which was open for twelve days, attracted 210,000 visitors—a figure which is considered disappointing in view of the fact that two extra days were allowed, together with a special "Popular Day" with an admission charge of only 6d.

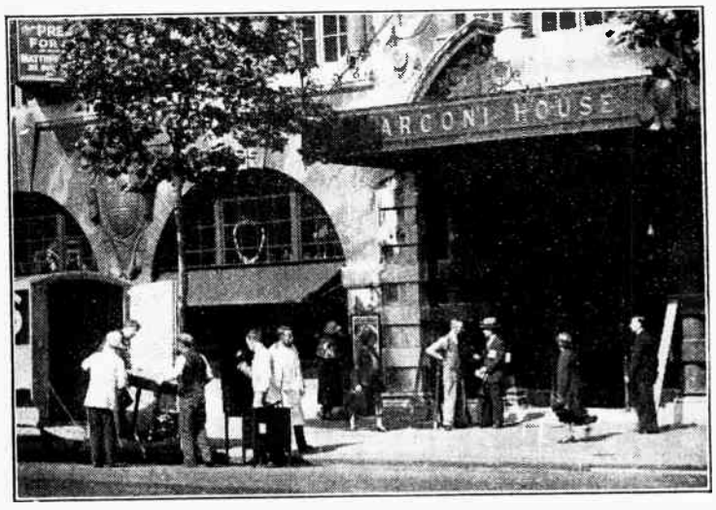
The Olympia Radio Show in London was visited by 225,000 persons in nine days.

More Listeners in Ireland

OVER 5,000 additional wireless licences were issued in the Irish Free State up to the end of July, and the total number is now 36,228.

Medical Radio Code

A CODE of words which should completely cover the needs of medical diagnosis and treatment by wireless will be contained in Volume II of the new International Code of Signals for Shipping which is to come into use on January 1st, 1934.



THE ORIGINAL 2LO. Marconi House, Strand, a London landmark for twenty-one years, photographed last week-end during the Marconi Company's removal to Electra House, Victoria Embankment.

B.A. Studies Television

TELEVISION experiments by the Marconi Company are a feature of this year's British Association meeting which opened at Leicester on Wednesday last, September 6th. Demonstrations are being given of television images on a screen 4ft. square. Fifty line images are shown with a repetition frequency of approximately fifteen per second.

A Necessary Accomplishment

THE view that everyone should have a working knowledge of wireless is supported by the French Minister of National Education, who dwells on the importance of wireless in the school. All teachers and others in authority, he declares, should be capable of assembling and maintaining a simple radio receiver.

Should Club Members Specialise ?

AN interesting scheme is being adopted by the Thornton Heath Radio Society. During the coming winter each member will make himself thoroughly familiar with a particular phase of radio reception. This should be a great assistance in enabling members to help each other to the best advantage.

B.B.C. : What Hungary Thinks

HUNGARIAN listeners have just registered their preferences in regard to the programme material of the various European countries. The countries are given in this order: Austria, Italy, Germany, Poland, France, Rumania, and Great Britain.

Anti-fire Radio

THE forest fire menace has been tackled by radio methods in the Marseilles district. On the wooded heights near the coast seven wireless transmitters have been installed, and during the hot season they are manned by sentinels, ready to communicate immediately with the Marseilles Fire Brigade on the outbreak of fire.

Another French High Power Station

"A FORMIDABLE instrument for radiating French Southern thought throughout the world" is the description applied to the new Toulouse-Pyrenees broadcasting station now nearing completion near Murat on a plateau some 700 feet above sea level. Its power will be 120 kW. The station, which is the property of the State, is not welcomed by the adherents of Radio Toulouse, who declare that the newcomer is quite unnecessary.

Short Waves from Bandoeng

MR. J. F. W. DE KORT (call sign PK1WK) of Bandoeng, Dutch East Indies, is transmitting on a wavelength of 49.42 metres. His schedule is as follows:—9.30 till 11.30 a.m.; 12.30 to 1.30 p.m.; and 11.45 p.m. to 12.15 a.m.

"Ultra Shorts" from Yacht

ULTRA-SHORT wave transmissions from a yacht cruising in the Solent will be undertaken by Mr. S. G. Morgan (G6SM) on Sunday next, September 10th. It is expected that transmissions will last from 10 a.m. to 6 p.m., and during this period an attempt will be made to keep in continuous touch with G5BY and G5NN located on Beachy Head.

Reports will be welcomed by G6SM at 3, High Street, Croydon.

Sir John Cass Institute

COURSES in electricity and magnetism are included in the curriculum of the Sir John Cass Technical Institute, Jewry Street, Aldgate, London, E.C., which resumes classes on Monday, September 25th. Students will be enrolled during the preceding week.

The science courses, which include the electrical studies, are held from 6 to 10 p.m., and full facilities are provided in well equipped laboratories for special investigations and research.

2LO "Closes Down"

MONDAY last, September 4th, saw the final closure of what was originally London's first broadcasting station. Marconi House, Strand, which was London's principal radio landmark before the war, has been vacated by the staff of the Marconi Company, who now occupy a section of Electra House, Victoria Embankment.

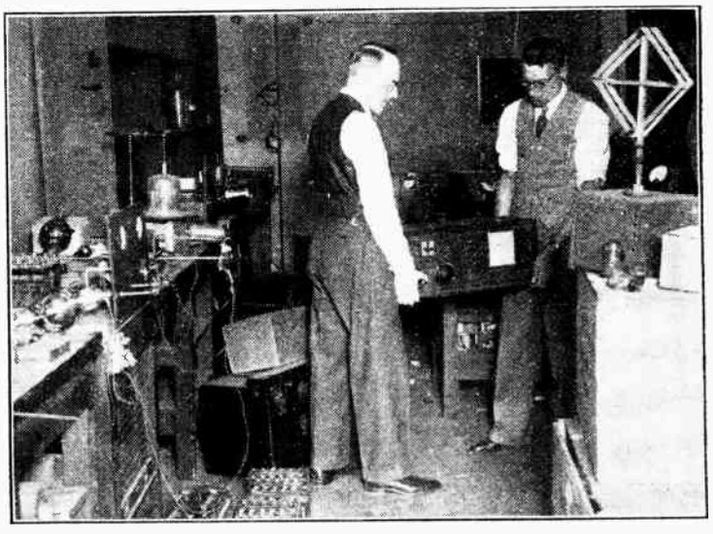
Marconi House, originally an hotel, was one of the first buildings in London to carry wireless masts, and it was the obvious choice in 1922 when the British Broadcasting Company sought a transmitter site in the heart of the capital. The original 1½ kW transmitter was housed near the roof, and had a remarkably good service area until superseded by a new transmitter on the roof of an Oxford Street store.

During the war Marconi House was an important receiving base for enemy wireless propaganda, and was also used for wireless research, particularly in the development of the thermionic valve.

Clubs and the Tax

THE new wireless tax is having a bad reception in France, and all kinds of pleas are being put forward by various interests in the hope that the Government may be induced, in special cases, to remit the fee. The radio clubs are especially vocal. They are championed by Dr. Fobeau de Courmelles, President of the National Federation of Radio Clubs.

The clubs, he points out, use their sets, not for broadcast reception, but purely for experiments and instruction to their members. The members, it is claimed, act as "benevolent recruiting sergeants for radio," increasing the number of licence holders as well as burning out numerous valves for the benefit of the tax collector. (In France there is a special duty on valves.)



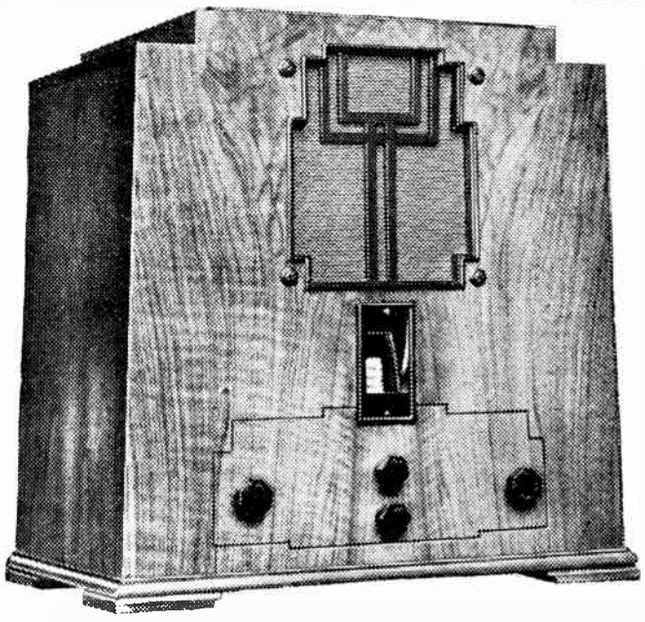
Marchese Marconi's private laboratory in the throes of removal last Saturday. Micro-wave apparatus had to be handled with special care.

"Ultra Shorts" in the Transvaal

THE Transvaal is developing an interest in the ultra-short waves, and we learn from a correspondent at Witbank that the amateurs in that area are arranging a series of tests.

There has been a considerable revival of radio interest in South Africa on account of the reliability of the B.B.C. short-wave service.

THE NEW HIGH POWER SUPER-HET WITH EXCLUSIVE STATIC SUPPRESSION



Seven valve band-pass super-heterodyne for A.C. Mains.

Absolutely consistent adjacent-channel selectivity.

Unique Static Suppressor, adjustable for minimum background.

Genuinely unlimited range.

2¼ watts undistorted output—enough for three extra speakers.

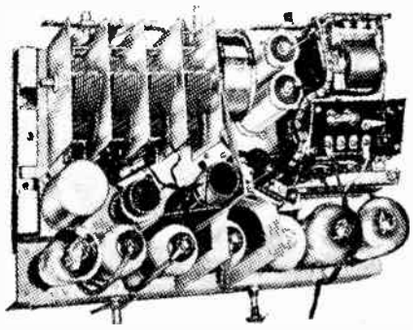
Full Delayed Automatic Volume Control.

Duplex tone control adjusting both bass and treble.

Illuminated scale carrying station names and wavelengths.

Superb energised moving coil speaker of wide response.

Hear this remarkable new model for yourself and you will realise that in its tremendous power, unprecedented selectivity and perfect tonal quality it is a definite step ahead even for Marconi. Merely to look at the figured walnut cabinet with its unusual lines and beautiful finish is to realise that here is something definitely different, definitely superior. But hear how the full Automatic Volume Control eliminates fading—how the super-selective band-pass circuits cut unerringly through interference—and how the unique Static Supressor provides a background of silence unbelievable in so powerful a set—then will you decide that Marconi 276 is your ideal 1934 receiver.



A rear view of the all-steel rubber mounted chassis, which gives some idea of its skilful design and fine engineering construction.

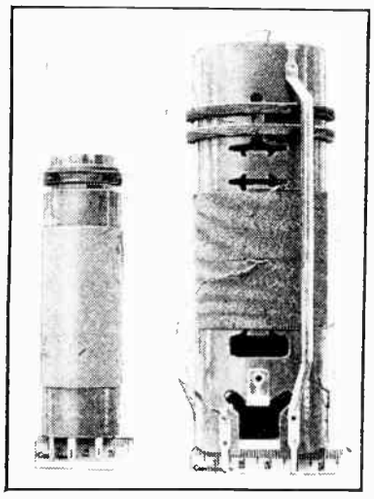
The Berlin Radio Show

A Review of the Exhibits

THE German Radio Show, which has just been held in Berlin, has received greater publicity and probably provoked more interest than any previous Berlin Radio Exhibition, partly for the reason that this year broadcasting has taken such an important position in political and Government affairs. The general appearance of the Exhibition this year has undergone



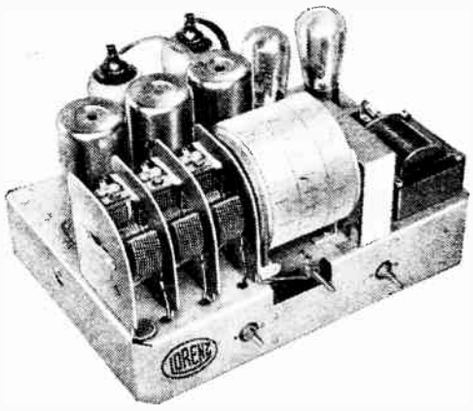
Examples of the new coil assemblies as generally used in the new German broadcast receivers.

a definite outward change indicative of the importance which the German Government now attaches to broadcasting as a means of propaganda. We are, however, not concerned here with the political aspects, and must confine our attention to a review of the technical progress which the exhibits at the Show revealed.

The set manufacturer has had the advantage of new valves of types similar to the new valves in this country to assist him in his designs, and the result is increased range and selectivity of receivers, a large number of superhets, including those employing only a few valves, and automatic volume control in all the more important models.

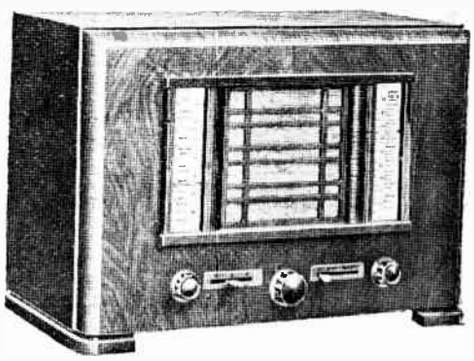
THIS YEAR'S radio show in Berlin was described as a Jubilee since it represented the 10th consecutive Exhibition since Broadcasting began. In the German receivers the greatest ingenuity is displayed in tuning arrangements and other mechanical devices rather than in originality of actual circuits employed. Although not of real technical interest, the introduction of the People's receiver was perhaps the most spectacular feature of the show.

In view of the need for increased selectivity, practically all receivers have employed coils of high efficiency, and the solid dielectric type of condenser which was popular in Germany in previous years has been replaced by well-built air dielectric condensers. The coils are almost invariably built in cylindrical form with stranded Litz wire. This improvement in tuning circuits has resulted in the appearance of even simple two-valve sets with tuning scales calibrated in station names.



Tuning drum rotatable through 360 degrees in the Lorenz three-circuit receiver.

The German receivers this year are notable for the variety of types of tuning dials, nearly all with station names, and mostly indicating these clearly with illuminated scales. The scales are of very varied construction. One firm, Lange, has two vertical scales, one on each side of the loud speaker; the left-hand scale gives the long-wave station names, and the right-hand those of the 200-600-metre band and the short-wave stations. Another firm, Lorenz, employs a very large drum scale with the station names in three zones side by side; this scale rotates through 360°. The firm

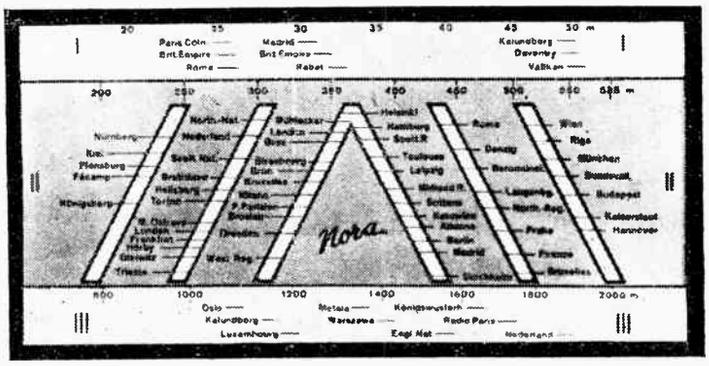


Arrangement of two scales on either side of the loud speaker (Lange).

Dr. Dietz and Ritter uses a pointer situated in front of the scale. Another divides the whole scale into several separate parts, and these three-wave zones are so arranged that only the correct one lights up. Siemens have developed a particularly original tuning device, the "Area" scale. In this there is a transparent band divided into various parts corresponding to the various German station groups and the groups of foreign transmitters. By means of a knob the wanted zone is adjusted behind the spy window. In this way the listener can always find the stations belonging to one locality grouped together. The scale also contains a zone in which all the stations are combined.

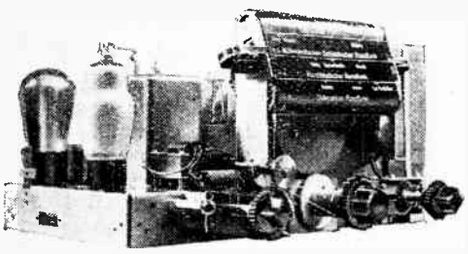
The Berlin Radio Show.—

Scale illumination is so arranged to-day in all German receivers that the lamp can be easily changed. In all new German receivers the chassis are made of steel throughout. In many cases, in the effort to simplify tuning the wave scales are arranged in the sloping-deck fashion at the top of the receiver. The number of knobs has been kept as low as possible; knobs fulfilling the same kind of functions are often placed on a common spindle. Almost everywhere it has been arranged that only the appropriate parts of the wave scale light up. Examples of chassis are seen in the illustrations.



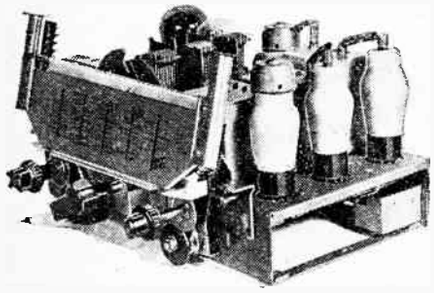
Another tuning scale for three wave ranges (Nora).

A great deal has been heard about the



"Areas" (geographical) scale in Siemens chassis.

People's receiver. A first order for these was for 100,000; before the Show 30,000 of these were sold; and by the end of the first few days of the Show another order for 100,000 had to be placed. This receiver is built in three different types—one for D.C., one for A.C., and one for battery supply. Both the mains types have two valves, a screen grid, and a pentode of 3 watts output. The battery receiver has three valves and employs a Class "B" output stage. The



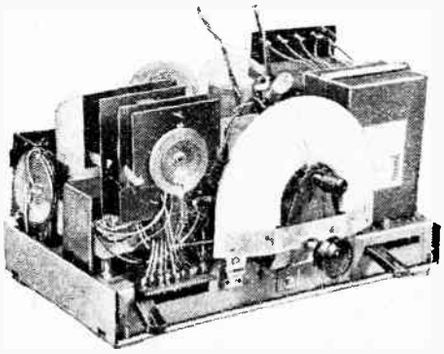
Chassis of a big superhet.

A.C. receiver is in a bakelite case, the others in cases of wood. The chassis is similar in all the receivers; the components are the same throughout, although twenty-eight different German manufacturers build the receivers. The external appearance is also the same, whatever the firm. Every receiver has a moving-iron type of loud speaker. The wave scale in the People's receiver is not calibrated in station names or wavelengths. The receiver has three adjusting knobs—on the left the aerial coupling, in the middle the wave adjustment, on the right the reaction coupling. All the components have to be approved by the Heinrich-Hertz Institute in Berlin. The receiver gives reliable reception of the nearest high-power stations and the Deutschlandsender, and also several powerful distant stations. It has no provision for short waves.

In addition to the People's receiver, which has only one tuning circuit, the industry has built other single-circuit receivers in large numbers; almost all these have provision for short-wave reception, embody a wave-trap circuit, and, as a rule, are so built that the constants of the aerial do not affect the tuning adjustment, so that the receiver can be calibrated in wavelengths.

Simple replacement of the illuminating bulb.

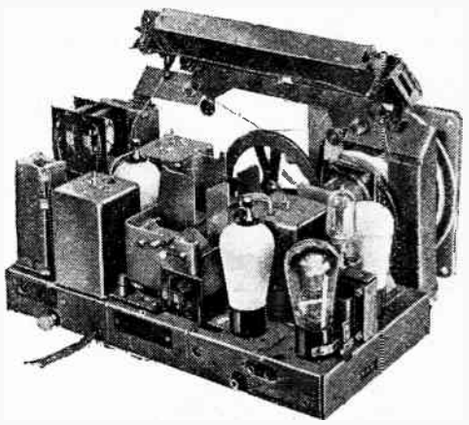
The three-valve two-circuit receiver and the four-valve three-circuit receiver are still being turned out in Germany, but the selectivity has been considerably increased by the use of the new high-frequency pentodes and the low-loss tuning circuits. The two-circuit receiver is almost always provided for short-wave reception. A novelty for Germany, on the other hand, is the three-valve superhet. A volume control and a tone adjuster are always provided. The selectivity is obtained by varying the band filter damping. Most firms build this set to include short-wave reception.



Chassis of the Telefunken two-valve receiver.

Then comes the four-valve superhet. This has a preliminary stage with high-frequency pentode. It is worthy of note that the Stassfurter Broadcasting Company, in this and in its five-valve superhet, uses coils with iron cores in all important positions.

A mixing and A.V.C. hexode, a high-frequency pentode as preliminary valve, and



Chassis of the Telefunken three-circuit receiver with four valves.

a binode, usually containing a screen grid amplifier stage, and a six-watt output pentode are the valves used in the big superhets. These are of very high quality, and all possess a so-called interference barrage—that is, an arrangement by which the sensitivity is decreased when interference becomes too strong. This is carried out either by a change of amplification of the preliminary valve, its grid bias being regulated by a switch, or by the use of a compensation device (Stassfurter Broadcasting Company), by which the noise level is decreased without affecting the range, sensitivity, volume, or quality. In addition, all big superhets this year are provided with the A.V.C. hexode, which, together with the

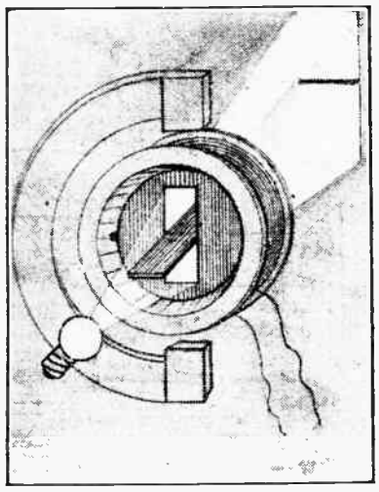
Telefunken four-valve three-circuit receiver.

binode, makes possible the compensation of fading over a very wide range of signal strength. Most big superhets possess also a "crack killer," and all superhets with five and more valves have, also, an arrangement for optical tuning. Several very different methods are employed for this: Telefunken, Siemens, and the A.E.G. use a shadow instrument; above the wave scale there is a small window with a ground glass disc illuminated by a small glow lamp. In the beam of this lamp there is a small rotatable mag-

The Berlin Radio Show.—

netic armature, which normally screens the whole beam. The armature can be moved out of its normal position by means of a coil through which the current to the loud speaker passes. At the maximum strength of signal the shadow cast on the ground glass by the armature is at its narrowest. Other firms use a glow lamp fed by the loud speaker voltage; in these lamps the length of the glow depends on the loud speaker intensity. Still other firms use a milliammeter in the anode circuit of the detector valve, the reading indicating the strength of a signal. All big superhets have a tone control and a manual volume control. A novelty in many new German receivers is the provision of a reading lamp, enabling the programme journal to be read even in a dark room.

Worthy of notice is a receiver which can be used either on D.C. or A.C. mains; for A.C. mains one rectifier valve must be inserted (Loewe).



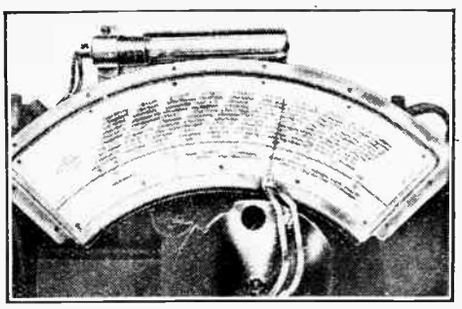
The principle of shadow tuning.

Numerous short wave adaptors have been produced this year. They are all based on the superheterodyne principle.

The battery receiver is not much in demand in Germany this year. It may be assumed, however, that even this season more battery receivers will be turned out as soon as the valve makers have produced the special valves now being developed.

The number of motor-car receivers has been added to by Telefunken. Their receiver is a four-valve superhet.

The moving-coil loud speaker rules the loud-speaker market in Germany this year. The permanent magnet type has been greatly improved.



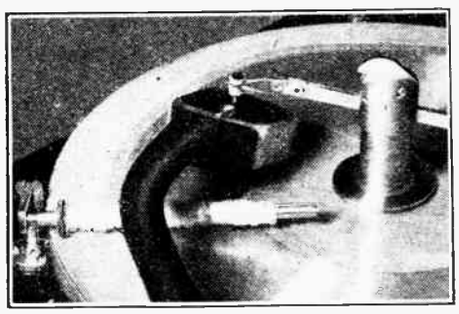
Saba Jubilee super with station names in staggered form.

The Trautonium is now officially sold by Telefunken; it has a quite new form and differs from previous models by possessing two "formant" (tone forming) circuits.

In the field of home recording of gramophone records a whole series of improve-

Telefunken motor-car receiver. Control box on the steering column. Inset: The four-valve superhet receiver.

ments have appeared. Telefunken has produced a high-grade portable instrument, in which, by the introduction of a different needle, the recording sound box can also be used to reproduce the record. Similar equipments are turned out by Grass and



An arrangement for winding up the cut shaving when recording.

Worff and by Budich. The Telefunken apparatus is a high-quality instrument.

A notable Telefunken novelty is the provision of a small rotatable shaft passing across the record in front of the recorder; this rolls up the shaving as it is cut. Numerous new microphones are exhibited, of which the Telefunken new "amateur" microphone is a good exampe. A new condenser microphone has appeared by von Ardenne.

In the field of components there are not very many, but still a few, novelties.

The Gautzsch Gluclicht Company has developed a testing set which should be particularly useful in the hands of radio traders. At the top of this instrument there is a long glass window. On this there are various signs; for example, the words "Faulty," "Filament Break," "Grid Displacement," "Too little Emission," and so on. If the valve to be tested is pushed into the sockets provided and the knob pressed, the writing on the glass window becomes visible corresponding to the fault shown by the valve. The firm Bittorf and Funke shows a testing set, displaying a whole number of sockets. The firm supplies a template for every type of valve purchasable in Germany. When such a template is laid over the sockets it gives access only to those required for the testing of the particular valve. A switch is provided which shows a large number of circuit connections corresponding to the volts to be tested for. If the switch is turned from one position to another, an indication is given whether the valve displays the fault corresponding to that position of the switch.

The firm Abrahamsohn makes an instrument for the checking of valve characteristics. This has a transparent glass window divided into squares. Over this window two pointers move; one is connected to the resistance regulating the grid bias, while the other is connected to the moving coil of a meter in the anode circuit of the valve under test. The crossing point of the two pointers gives the anode current corresponding to a given grid bias. Transparent discs can be

High-quality apparatus for recording gramophone records with a glow lamp for observing the modulation.

laid on the glass window on which are marked the valve characteristics of the various valve types on the market. If the valve is a good one, the crossing point of the two pointers must agree more or less exactly with the characteristic line on the disc.

The elimination of interference takes an important place in the Exhibition. New searching equipment for tracing the origin of interference was shown, and kits containing all the various components which anyone can need in order to eliminate the disturbances.

Screened aerial down leads and their accessories have been particularly developed this year, numerous firms participating in this, including Telefunken, A.E.G., Kathrein, Lindner & Co., Pawlick, Ehrl, and others.

In next week's issue a description of the television section of the Berlin show will be included.

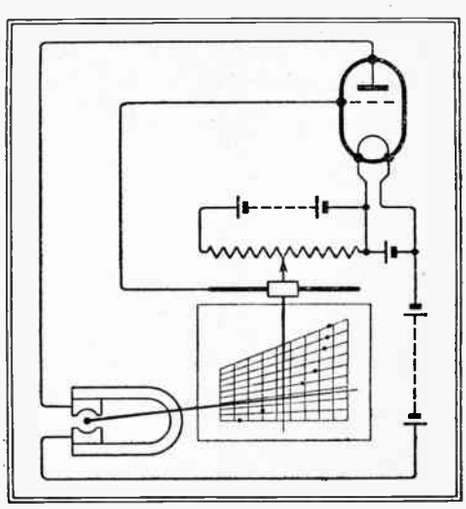


Diagram explaining the principle of an apparatus for checking the valve characteristics.

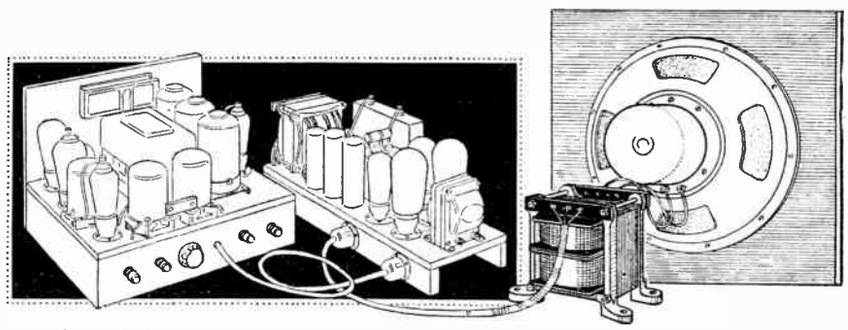
Push-Pull Output Transformers

A Special Design for the New Monodial Super



ALTHOUGH the output transformer is often neglected, it can exercise a profound effect upon the performance of a receiver in regard to the quality of reproduction. In this article, constructional details are given of a push-pull component designed especially for the "New Monodial Super."

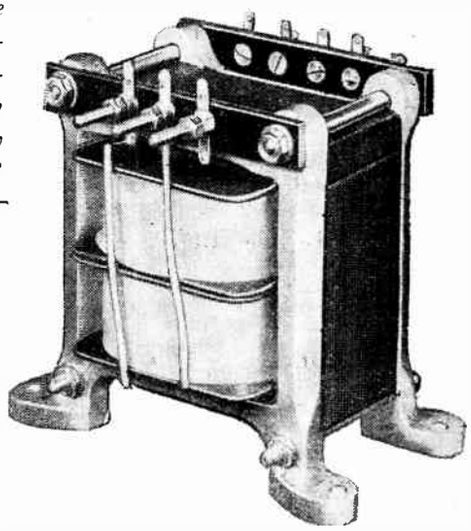
THE choice of a suitable output transformer is a matter requiring no less care than the selection of an intervalve coupling, if the best reproduction is to be obtained. The output stage is designed to work with a definite value of load impedance—in the case of the New Monodial Super it is 10,000 ohms—but it is rare to find that the loud speaker has the precise value required. The two are joined together, therefore, by means of a transformer with its ratio so chosen that the effective impedance of the speaker is altered to the necessary degree. Thus, the speaker may have an impedance of only 1 ohm and the output stage may require a load impedance of 10,000 ohms, but the use of a transformer of 100-1 ratio will result in the equivalent of a 10,000 ohms speaker with a 1-1 ratio transformer.

The question of ratio does not enter into the choice of primary inductance for the transformer, and we can consider the primary as a choke in shunt with the load impedance. Since the reactance of a choke falls with decreasing frequency, it is obvious that the efficiency of transformation will fall at low frequencies. It can be shown that the loss of bass due to this is small if the choke reactance is not lower than the load impedance at the lowest frequency required, but this is not all. As the load and the primary must be considered to be in parallel, the effective load impedance of the output stage falls as the frequency decreases, with the result that the maximum undistorted output obtainable also drops. There is thus a risk of amplitude distortion arising at low frequencies through the use of an output transformer with an inadequate primary inductance.

The Transformer Primary

If this effect is to be negligible, a higher primary inductance is required than is necessary merely for the maintenance of an even response curve at low frequencies, and in general the primary reactance should not be less than twice the load impedance at the lowest frequency required. For a 10,000 ohms load and a low frequency limit of 50 cycles, this means a primary inductance of some 63 H. or more.

The next point of importance is the power rating. It is more a question of the A.C. volts developed across the primary at the lowest frequency than of actual power, however, and with a 10,000 ohms load and a 6 watts output we must allow for a maximum potential of 245 volts across the load impedance. The flux density in the core must not be allowed to exceed a certain figure if amplitude distortion is to be avoided, and it is



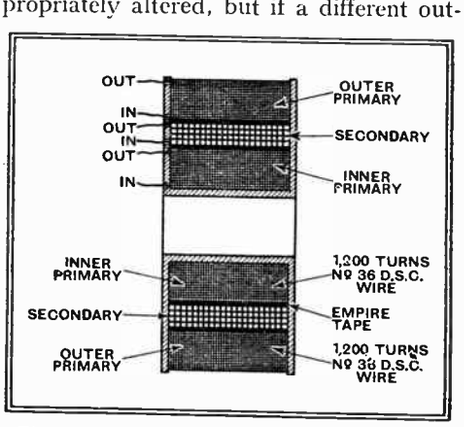
dependent upon the quantity of iron, the number of primary turns, the voltage developed across the primary, and the frequency. For a given voltage and frequency there is a minimum quantity of iron and number of turns which must be used if distortion is to be avoided.

Both primary and secondary resistances must be low if the general efficiency is to be high, and an appreciable proportion of the power delivered by the output stage is not to be lost in the transformer. In theory, maximum efficiency will be secured for a given winding space and number of turns when the secondary resistance is equal to the primary resistance divided by the square of the turns ratio. In practice, however, it is usual to make the secondary resistance rather higher than this for two reasons—because the primary resistance causes a loss of anode voltage on the output stage, and we like to keep this as small as possible, and because when a high ratio is used the secondary wire gauge demanded by theory is apt to become unwieldy. With any reasonable choice of wire gauges the resistance losses are very small.

Leakage Inductance

One of the most important points is the question of the leakage inductance, for this governs the high frequency response, and if it be large there will be a loss of high notes. For a given method of winding, the larger the primary inductance the greater the leakage, so that if we aim at perfection in the bass we run a risk of losing the upper register. Obviously, therefore, we cannot afford to make the primary any higher than is strictly necessary. The leakage inductance, however, is not governed merely by the primary inductance, but it depends very largely upon the physical disposition of the windings, and by properly interleaving the primary and secondary it may be kept at a low value. The self-capacity of the windings is fortunately of no practical importance, and a high self-capacity is beneficial rather than otherwise.

It will be seen, therefore, that the choice of an output transformer is a matter of some importance. The primary should be selected according to the output stage with which it is to be used, and the turns ratio according to both speaker and output stage. If the speaker be changed at any time the secondary winding must be appropriately altered, but if a different out-



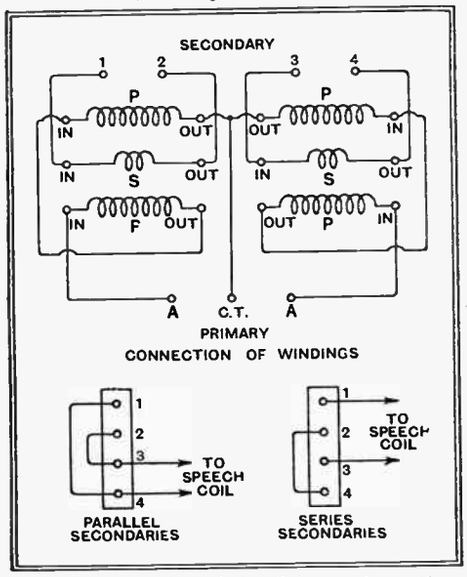
The method of winding can clearly be seen from this drawing of one of the bobbins. The other bobbin is identical save for the direction of winding.

Push-Pull Output Transformers—

put stage be employed, then it is to the primary that modifications must be made.

In designing a transformer for the New Monodial Super, another factor enters owing to the use of push-pull, for this necessitates a centre-tapped primary and a symmetrical disposition of the windings. Fortunately, however, the absence of a direct current through the primary renders the use of an air-gap in the core unnecessary, so that fewer turns and a smaller core can be used than if the transformer were for a single output valve.

The arrangement of the windings can clearly be seen from the drawings. Two identical bobbins are used, each carrying one-half of the primary and one-half of the secondary, and the total primary turns on each bobbin are 2,400. No. 36 gauge D.S.C. wire is used for the primary, and on each bobbin all windings are in the same direction. The two bobbins as a whole, however, are wound in opposite directions, so that the two extreme inner ends of the primary are for connection to



The upper portion of the diagram shows the connections between the windings and the terminals, while the lower gives the speaker connections.

the anodes of the output valves, and the two extreme outers are joined together for the centre-tap. Complete symmetry is thus readily obtainable. The secondaries are connected either in series or parallel, according to the ratio required; in the series connection the two outers are joined together, and the speaker connected to the two inner ends, but in the parallel connection the outer of one winding is joined to the inner of the other, and the outer of the latter is taken to the inner of the first, the two ends thus formed being taken to the speaker.

It is unnecessary to make any attempt at a layer winding for the primary, and it will suffice if the turns are run on as evenly as possible, so that a good surface is maintained for winding the secondary. After winding 1,200 turns a layer of Empire tape should be wrapped round it for insulation purposes, and the secondary can be put in place. Here an even layer winding is essential on account of the thickness of the wire; the turns should be run on evenly and tightly, but in spite of this there will usually be a tendency for the winding to assume a circular rather than a square shape. After the secondary is completed, therefore, the winding should be gently tapped down with a hammer and a block of wood. Another layer of Empire tape should be placed round the winding, and the outer primary section of 1,200 turns can be wound. The second bobbin should be identical with the first, save that all windings should be in the opposite direction.

During winding the formers should be mounted between stout end cheeks to prevent any tendency for the former to collapse; a small winding machine fitted with a revolution counter is a great help, but not strictly necessary. Owing to the fine gauge of wire used for the primary it is a wise plan to solder a short length of heavier wire to the ends for leading out.

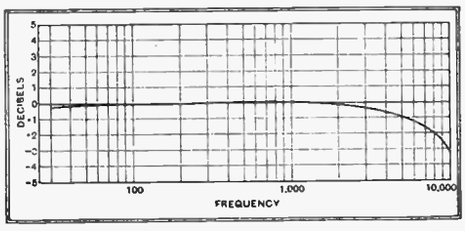
Table giving winding data for transformer secondary turns to match some leading makes of loud speakers.

Speaker.	Speech Coil Impedance.	Ratio.	Secondary Turns per Bobbin.	Wire.	Connection of two Secondary coils.
Magnavox Dual	0.8 ohm	112–1	42	No. 18 D.C.C.	Parallel
Rola Dual	1 ohm	100–1	48	No. 18 D.S.C.	Parallel
Magnavox Single	1.6 ohm	79–1	62	No. 20 D.C.C.	Parallel
Rola Single	2 ohms	70.7–1	68	No. 20 D.C.C.	Parallel
B.T.H. R.K. Senior and Ferranti M.2. and D.3	15 ohms	25.8–1	93	No. 20 D.S.C.	Series
Ferranti M.1	20 ohms	22.3–1	108	No. 22 D.S.C.	Series

Where both secondaries are normally paralleled, one-half the ratio will be obtained by joining them in series, and it will be suitable for matching a speaker of four times the normal impedance. Thus, the 70.7–1 ratio with paralleled windings for a 2-ohms speaker will give a ratio of 35.35–1 when the secondaries are connected in series and will then match an 8-ohms speaker.

The Secondary.

When the coils are completed the bobbins should be placed together and the core inserted. The "T" and "U" pieces are inserted alternatively on opposite sides in the manner of a mains transformer, and when the core is completely filled the end plates can be loosely bolted in place. The core should then be gently tapped home with a hammer, and the clamping bolts finally tightened. Small strips of insulating material carried by the ends of the



The measured response curve for a 112-1 ratio transformer; the loss at 30 cycles is less than 0.5 DB and at 8,000 cycles it is only 2 DB.

clamping bolts serve for the terminal blocks, and the method of connection should be clear from the drawings.

The accompanying Table shows the number of secondary turns, the gauge of wire, its insulation, and whether the coils are to be connected in series or in parallel, for a number of loud speaker types in more common use. The component illustrated was built to have a ratio of 112-1, and gave a measured primary inductance of 69 H.; the total primary resistance was only 300 ohms, so that with push-pull valves taking 40 mA. apiece the anode voltage is reduced by some 6 volts only.

The response curve has been measured, and is illustrated here; it will be seen that it is level within 2 DB over the 50 cycles to 8,000 cycles range, and by extrapolation it can be seen that the useful frequency range is considerably greater for a drop of 5DB is probably inaudible.

The materials necessary for constructing the transformer are quite few in number, and consist of:—

100 pairs of No. 4 stampings.
2 half-size No. 4 bobbins.
1 pair of end plates with clamping bolts.
1 lb. No. 36 D.S.C. wire.
1 lb. wire for the secondary.
2 terminal strips, 4 B.A. nuts and bolts, Empire tape.

The transformer iron, bobbins, and end plates employed in constructing the experimental model were supplied by Sound Sales, who would doubtless supply the transformer completely assembled to special order.

Although designed specially for the New Monodial Super, this component may be employed with any apparatus fitted with a similar type of output stage.

NEW BOOKS

Modern Electric Clock, by Stuart F. Philpott. Sir Isaac Pitman & Sons, Ltd. 1933. Price 7s. 6d. net.

This book appears at a very opportune moment, for the adoption of frequency control in the A.C. supply systems of the leading electricity undertakings has stimulated wide interest in synchronous electric clocks. All the leading makes of this type are described and illustrated and the underlying principles fully explained. This section of the book should be of special interest to wireless users as the two subjects meet on common ground at many points.

The information contained in this manual is essentially of a practical nature and covers every type of electrically energised timepiece. It should prove of considerable value in choosing the best type of mechanism for any given purpose and as a guide in installation and maintenance work.

"Broadcast Advertising. The Fourth Dimension," Television Edition, by Frank A. Arnold.—A descriptive and explanatory account of advertising methods in use in connection with sponsored programmes in the United States, including sample advertising programmes. Pp. 284+xix. LABORATORY TESTS

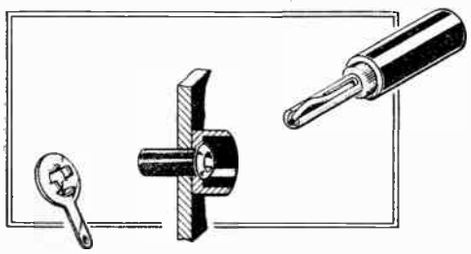
NEW RADIO PRODUCTS REVIEWED

GRIPSO SELF-LOCKING TAG AND SOCKET

OF the many new items recently introduced by the Gripso Co., 28, Victoria Street, London, S.W.1, the Self Locking Soldering Tag is of particular interest, for it serves the dual rôle of a fixing for the socket and the media for connecting leads. The socket is passed through a clearance hole in the terminal strip, the locking washer is threaded on the back and the whole firmly fixed in position by a sharp blow with a hammer using a special hollow punch. The hole in the tag is provided with a number of serrations which grip firmly both the socket and the terminal strip.



Gripso self-locking tags and sockets, also New Midget wander plug.

Two sizes are available, one with sockets to take ⅛in. plugs at 8d. per dozen sets and the other for 3/16in. plugs costing 1s. per dozen sets. Sockets with erinoid insulated heads engraved or plain and in two colours, also insulating bushes for use with metal panels are available.

With these the new Midget Wander Plug can be used. This has a solid pin slotted on one side and fitted with a strong flexible spring which ensures a good electrical contact. These plugs are for general purpose use and range in price from 1d. to 2d. each according to size. The special hollow punch and die for fixing the tags costs 1s. 6d.

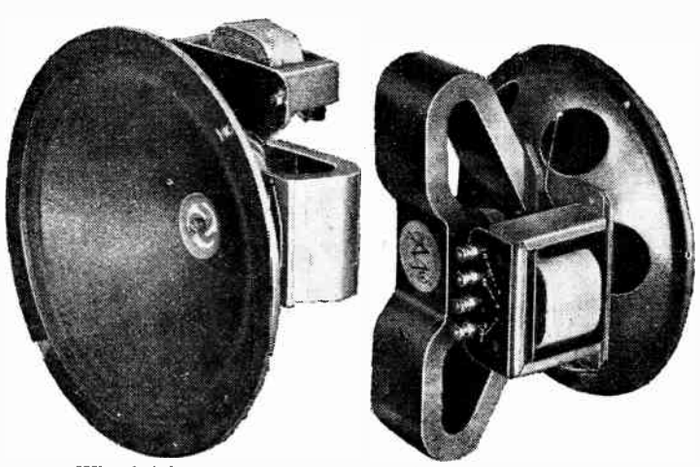
WHARFEDALE LOUD SPEAKERS

THE units submitted for test were the "Bronze" and "Golden" models. Both are notable for their rugged construction and the generous dimensions of the magnet systems. A notable feature is the method which has been adopted to ensure the exclusion of foreign matter from the air gap. Particles falling in towards the apex of the cone are stopped by a fine-mesh gauze behind the centring spider, while the back of the gap is sealed by a sponge rubber ring surrounding the centre pole-piece.

There is little to choose between the two models from the point of view of efficiency and sensitivity. As regards frequency response the "Golden" model has a better output in the bass below 100 cycles on account of its larger diaphragm, and in the extreme top its higher price is again justified. In both models there is an appreciable response at 8,000 cycles, but whereas the "Bronze" model commences to fall off at 4,000 cycles, the output of the "Golden" model is fully maintained up to 5,000 cycles. The bass resonance occurs in the "Bronze" model at 145 cycles and in the "Golden" at 120 cycles, but in neither case is it sufficiently prominent to colour the quality of reproduction. Apart from a slight increase in output in the region of 2,500-3,000 cycles the response in the middle and upper middle registers is in both cases sensibly uniform. The prevailing impression of the quality is one of brightness without too heavy a bass response. Reproduction of speech is exceptionally good.

The output transformers have interleaved and impregnated windings and are of more than usually generous design. Tappings are provided for matching to all types of output stages including Class "B."

Made by Wharfedale Wireless Works, 62, Leeds Road, Bradford, the "Bronze" model costs 39s. 6d. and the "Golden" model 63s.



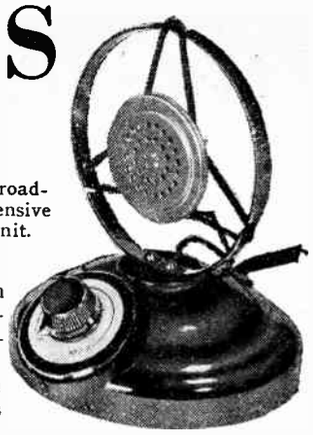
Wharfedale permanent magnet moving coil loud speakers (Left) "Golden" model. (Right) "Bronze" model.

AN INEXPENSINE MICROPHONE

THE G.E.C. Home Broadcaster is an inexpensive microphone having many uses both practical as well as entertaining. It is eminently suitable for Home Recorders, for announcing gramophone record titles at dances and at garden *fêtes*, as well as broadcasting matter of general interest at these functions, at amateur theatricals and for experimental transmitting work, to mention but a few only of its possible applications.

A normal broadcast receiver having facilities for gramophone reproduction is quite suitable for many of these occasions, the Home Broadcaster being connected by a change-over switch to the pick-up terminals so that either microphone or pick-up can readily be brought into use.

The unit is entirely self-contained, and consists of a sensitive carbon-type microphone, a volume control, an input transformer, and clips for a small torch battery; the last two mentioned being accommodated in the base. It is equipped with 25ft. of cable screened to avoid pick-up of mains hum and other extraneous electrical noises.



G.E.C. Home Broadcaster, an inexpensive microphone unit.

The specimen tested was very sensitive, showed a most satisfactory frequency response, and altogether is an ideal instrument for home and experimental use. The makers are the General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2, and the price is 18s. 6d.

The Radio Industry

"NEW Notes in Radio" is the title of an informative little booklet recently issued by Hartley-Turner Radio, Ltd., of Thornbury Road, Isleworth, Middlesex. It presents a good résumé of the principles underlying the design and construction of moving-coil loud speakers, with particular reference to the Hartley Turner instrument. Much useful information is given on the associated problems of field current supply, L.F. amplifiers, and matching.

In addition to the various screened aerial down-leads, which are already well known, Ward & Goldstone have just introduced a metal screened earth lead. Both the three-stranded conductor and the external wire braiding are of heavy gauge, and the insulation is completely waterproof. The use of a screened earth lead is in some cases beneficial in reducing background noises, and is likely to be particularly useful when a screened aerial system with impedance-matching devices is installed.

British wireless products are getting far afield. According to the Chloride Co., an Exide H.T. accumulator battery of 220 cells has just been despatched to the palace of the Dalai Lama, in the "forbidden city" of Lhasa, the capital of Tibet.

The company also announce a reduction in the prices of several types of dry-cell H.T. battery designed for certain well-known self-contained receivers.

The works of the Harken Electrical Co., Ltd., have now been transferred from Walworth Road, London, S.E., to 18a, South End, Croydon. Under the managing directorship of Mr. E. Harker, recently engineer-in-chief to the Post and Telegraph Department of Ceylon, this firm specialises in radio and other apparatus for use in tropical countries.

We are informed that the servicing of Atwater Kent receivers has now been taken over by the Radio Development Co., of Aldwych House, Aldwych, London, W.C.2. This company also undertake repairs to Fada and other American receivers.

New Catalogues Received

Blue Spot Loud Speakers and Units: The British Blue Spot Co., Ltd., 94-96, Rosoman Street, Rosebery Avenue, London, E.C.1.

Wharfedale Loud Speakers: Wharfedale Wireless Works, 62, Leeds Road, Bradford.

Oldham "Insured Life" Accumulators: Oldham and Son, Ltd., Denton, Manchester.

Clix Connectors, Terminals, Plugs, Valveholders, etc.: Electro Linx, Ltd., 79a, Rochester Row, Westminster, London, S.W.1.

Broadcast Brevities

By Our Special Correspondent

200 Kilowatts at Droitwich

BRITISH listeners who have been perturbed by the thought that the B.B.C.'s National transmitter at Droitwich will be limited to a power of only 100 kW. will be glad to learn that the B.B.C. is very much more ambitious than the published announcements would lead one to expect.

I understand that provision will be made for a transmission power of not less than 200 kW.—sufficient to make the British transmitter a match, as it should be, for Luxembourg, hitherto the most powerful station in Western Europe.

Open-air Drama

The output stage of the great transmitter now nearing completion at the Marconi Works, Chelmsford, will contain four of the new C.A.T. valves, each rated at 50 kW.

Just now there is a real open-air drama being enacted in that Worcestershire meadow, three miles from Droitwich.

It is a fight against time and weather.

The aim is to get the lid on before the wet weather sets in. When once the building has a roof the transmitting apparatus can be installed.

Testing by March?

He would be a bold man who would prophesy that the B.B.C. will wait until midsummer, 1934, as announced, before sending out test signals.

I am not bold enough to make any such prediction, for I believe that we shall hear the first signals from Droitwich by April, possibly March.

Meanwhile, the masts are ascending inch by inch, and will soon be half as high again as St. Paul's Cathedral, London.

A Lord Dunsany Play

LORD DUNSANY has written a new play especially for broadcasting. It is called "The Use of Man," and will be heard in the National programme on September 26th. The characters include human beings and the spirits of animals, birds, and insects. Listeners will no doubt recall another of Lord Dunsany's plays—"If"—which has been broadcast on two or three occasions in the past.

Don't Take This Seriously

"COUNTER Clockwise," by Moultrie Kelsall, which is to be broadcast on September 18th, is a programme designed to explode historical myths. The three myths exploded are, first, that Bruce learned his statecraft from a spider; secondly, that Burns was a haggis addict; and, thirdly, that Bonny Prince Charlie divided up his tartan apparel among the enamoured ladies of the Highlands.

I understand that, on the last occasion on which these sketches were broadcast, some listeners took them seriously, and their national pride suffered in consequence. No disparagement of these national heroes, however, is intended, and the explosions are as mythical as the myths themselves.

Think that out.

Devolution

NOT *decentralisation* but *devolution*, I am told, is the guiding principle in the new organisation which characterises the B.B.C. in all its branches from Land's End to John o' Groats.

The Organisation

The scheme can be sketched in a few words. At the head is Sir John Reith; on his left sits Admiral Sir John Carpendale, head of Administration, and on his right Colonel A. C. Dawnay, the new Controller of Output.

Under the principle of devolution this organisation is repeated in miniature, as it were, at each of the Regional headquarters. Thus we find at the Scottish Regional Mr. Melville Dinwiddie in charge; his Administrator is Mr. J. M. A. Cameron, and his Programme Director Mr. Moray McLaren; this form of organisation holds good north, east, south and west.

A Talented Musician

By the way, I am glad to hear that Mr. Hely-Hutchinson's transfer to the post of music director in the Midland Region does not mean that this extremely talented musician is lost to London audiences. I venture to predict for Mr. Hely-Hutchinson a great musical future, and many listeners will feel that the Midland Region is honoured by the appointment.

Mr. Aylmer Buesst

Mr. Aylmer Buesst, who is to become chief assistant to Dr. Boult, is an Australian who has already had a distinguished career as a conductor and will no doubt wield the baton at many broadcast concerts in the near future.

St. Leger Broadcast

A RUNNING commentary on the St. Leger will be broadcast on Wednesday next, September 13th, by Mr. R. C. Lyle, the well-known racing correspondent, whose descriptions of the Derby and other racing events are always popular with listeners, especially those backing the winner.

Hunted

NO wonder, during these dog days, the B.B.C. officials wear a hunted look. They *are* hunted, for the daily Press, robbed of so many sources of intellectual food, such as the Houses of Parliament and the Law Courts, seems to turn naturally to broadcasting for its stunts.

If an official distributes an innocuous circular encouraging lady members of the staff, if they feel so disposed, to enquire what exactly would be their position in the event of marriage, the Press sleuths manage without difficulty to turn the event into a first-class "story."

No Crèche in Portland Place

Not that very much harm is done, for the B.B.C., after its initial embarrassment, welcomes publicity and rejoices in its ability to explain an entirely well-meant effort on its part to reassure its women employees.

As one member of the staff remarked to me: "We wish to be fair all round, but even we cannot be expected to run a crèche."

Why not leave it at that?

CONTROLLER OF OUTPUT. Col. A. C. Dawnay, who assumed control of the "output" section of the B.B.C. on Monday last.

"La Bohème"

SADLER'S WELLS Theatre in Islington will be the venue of a relay in the National programme on September 19th, when Acts I and II of "La Bohème" will be broadcast. It is some time since listeners last heard a relay from this theatre, from which several performances of opera have been successfully broadcast in past years. Act I of Gounod's "Faust" will be relayed from this theatre on September 30th.

Smash and Grab

A STRONG cast will be heard in "One Good Turn——," described as a "Smash and Grab Presentation of Road House Variety," to be broadcast on September 12th (Regional) and 13th (National). The book and lyrics are by Max Kester and Ray Noble respectively, and the latter's orchestra will take part in the performance. Included in the cast are Anona Winn, Suzanne Botterell, Al Bowlly, Bobbie Comber and Claude Hulbert.

Bouquets and Broadcasting

THE dear old-fashioned habit of sending up bouquets to the stage at the end of the opera or village concert has never, for some reason, been adopted by broadcast listeners. I have never seen a queue of messenger boys with floral tributes at the back-door of Broadcasting House at the conclusion of the evening programmes.

If You Send Flowers . . .

I mention the subject only in case you should ever conceive the idea of paying tribute in this manner, possibly when you have heard Mr. Maschwitz's Eight Step Sisters. Make sure that the flowers are absolutely fresh and, if possible, encased in ice. For it has been observed that flowers in the studios are doomed to a short life. The oxygenated air will serve a *prima donna* for ten minutes, but apparently it cannot keep flowers alive for more than a day or two. *Verb. sap.*

Correspondence

The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Wireless World," Dorset House, Stamford Street, S.E.1, and must be accompanied by the writer's name and address.

Television

ALTHOUGH it is only recently that I turned up some of my first numbers of *The Wireless World*, this is my first letter to your paper.

I write to support the Hon. Sec. of the Halifax Wireless Club. Experimenters in the North may well ask "What is this television?" I have just dismantled a television set because it was useless to continue attempts at reception. With the transmissions from London Regional I had fairly good results, but London National is hopeless in this locality. I also feel that I was let down in connection with the Fultograph transmissions. Will television come to the same ignominious end? Possibly, unless keen experimenters all over the country, and especially in the North, are allowed a "look in."

"A YORKSHIRE PARSON."

Electricity Supply

WITH reference to your correspondent's letter on "Continuity of Electric Supply" in your issue of the 25th Aug., I append an extract which may be of some interest:—

Section 12 (2) of the Electricity (Supply) Act, 1919, states: " . . . there shall be incorporated with this Act the provisions of the Schedule to the Electric Lighting (Clauses) Act, 1899, subject to such exceptions and modifications as may be prescribed by the order constituting the joint electricity authority."

Section 30 (1) of this schedule states: "Whenever the undertakers make default in supplying energy to any owner or occupier of premises to whom they may be and are required to supply energy under the special order, they shall be liable to a penalty not exceeding 40s. for each day on which the default occurs."

From this it is clear that the supplying authority has very definite obligations.

A. K. T.

Teddington, Mddx.

Eliminating Interference

I HAVE recently visited the German Radio Exhibition and feel that all who saw it must have shared my keen interest in the demonstrations and exhibits of the German Reichspost in connection with the elimination of interference from electrical machinery.

I was particularly struck by one very simple arrangement for eliminating interference from small motors with series field windings which I find was mentioned, though without special comment, by Mr. Bernaert in his article in your issue of July 7th, 1933. I refer to the division of the field winding into two equal parts, one being placed in each supply lead. If a condenser is then placed across the brushes, it forms with the two sections of the field winding a symmetrical filtering arrangement which is stated by the German engineers to result in a substantially complete elimination of interference.

I do not know to what extent such an arrangement would be applicable to the various types of commutator motor for alternating and direct current, but as it involves a change of manufacturing practice, namely the division of the field windings into two similar sections connected one in each main lead, with the armature between them, it would appear to be a matter deserving careful investigation and decision, particularly when it is borne in mind that such motors are extremely common and give rise to a very great deal of troublesome interference.

P. W. WILLANS.

London, W.C. 2.

Double Channel B.B.C. Transmissions

RECENT research into high quality sound reproducing systems has shown that considerable improvement can be obtained by the use of a double channel reproducing system consisting of separate microphones each with its own amplifier and reproducer. In a recent test a considerable number of observers preferred a double channel system with an upper cut off at 2,800 c.p.s. to a single channel system with a 12,000 c.p.s. limit.

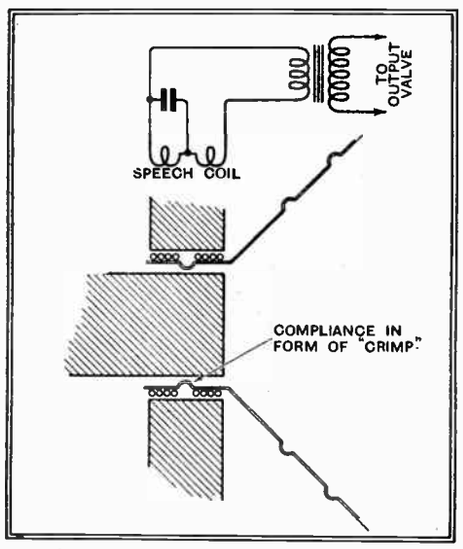
Here we have an excellent opportunity of turning the B.B.C. regional scheme to good use, and I suggest that when two or more stations are radiating the same programme, arrangements should be made to use two microphones. Listeners who were prepared to purchase the extra equipment could then avail themselves of the advantages of a double channel system without any interference with the normal purpose of either station serving listeners with single reproducers. It would be interesting to have comments upon the proposed arrangement.

Rugby. JAMES MOIR.

NEW HIGH QUALITY LOUD SPEAKER

A Moving Coil with Uniform Mechanical and Electrical Impedance

SO far, one of the most successful methods of reproducing sound over a wide range of frequencies has been to use at least two types of loud speaker—a large moving coil cone unit for the low notes and a moving coil horn or "tweeter" for the higher frequencies. Filter circuits are employed to keep out of the respective speaker units the frequencies assigned to the other, and the system is comparatively expensive and by no means easy to design or adjust.



In the Olsen moving coil loud speaker the moving coil is divided into two sections coupled by a mechanical compliance which, in conjunction with a by-pass condenser, short circuits a section of the coil at frequencies above 1,000 cycles.

At the recent I.R.E. Convention in Chicago, a new type of moving coil loud speaker was described by Dr. H. F. Olsen, of the R.C.A. and Victor Corporation. This unit, which has a frequency range from 90 to 10,000 cycles, is based on an interesting combination of electrical capacity and mechanical compliance which considerably extends the high frequency range and enables the performance of the dual unit system to be obtained from a single loud speaker.

The moving coil loud speaker of normal design consists of a coil of wire moving in a strong magnetic field and a cone diaphragm which imparts the coil vibrations to the surrounding air. At low frequencies this coil moves as a piston, but at high frequencies the mechanical impedance is so large that considerable power must be expended to move it. At the same time, the electrical impedance of the speech coil, which is made up of inductance and resistance, increases with frequency so that above 1,000 cycles the loud speaker load no longer matches the impedance of the power valve. This again results in a loss of power. In order to achieve uniform mechanical and electrical impedance over the frequency range, Dr. Olsen divides the speech coil into two sections as shown in the accompanying diagram. The two sections are coupled mechanically by a "crimp" in the paper coil former. This functions as a compliance, which is the mechanical analogy of a condenser. The section of the coil remote from the junction with the diaphragm is shunted by a capacity which by-passes the current in this section above 1,000 cycles. At the same time, the mechanical compliance is adjusted so that the shunted section of the coil remains stationary at frequencies above 1,000 cycles. Thus, only part of the coil is in use, and as the diaphragm is corrugated to reduce its effective area, the mechanical and electrical impedances at high frequencies do not rise appreciably above their normal values.

According to reports, subjective listening tests show that the high-frequency response is decidedly better than that of the present type of moving coil units, and laboratory tests have shown that the acoustic output is practically uniform up to 10,000 cycles as compared with an average cut-off at 5,000 cycles in the average moving coil unit.

IN the rush and turmoil of the recent Radio Show it is possible that many visitors overlooked the less spectacular sections of the G.P.O. exhibit. For their benefit, and also for that of readers who were unable to go to Olympia, attention may be drawn to a little-known application of anti-interference filters which was officially advocated by the technical staff in attendance. The Post Office engineers have now had so much experience in these matters that their pronouncements should carry weight.

A Barrier to Interference.

The more usual type of filter, connected in the mains feed of the receiver itself, has been discussed from various points of view. It is often completely effective, but cannot in any way mitigate the ill-effects of interfering impulses passed into the building by the electrical mains and then re-radiated to the aerial from the house wiring. Clearly, the better plan is to filter out all H.F. energy at the point where the mains enter the building; the main objection to this

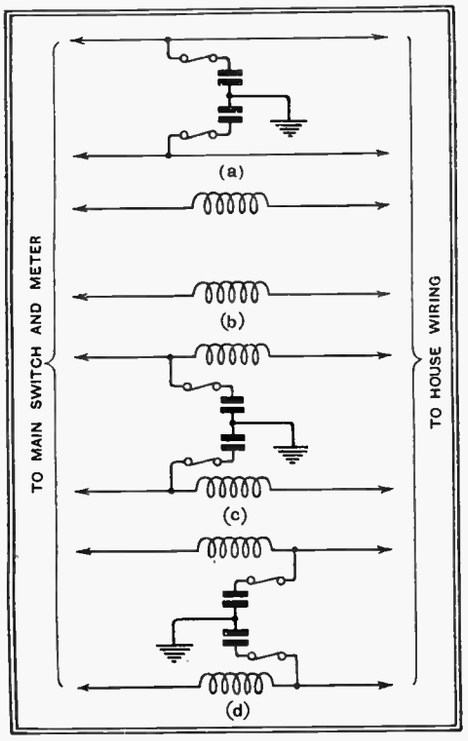


Fig. 1.—For keeping interfering impulses out of the house-wiring system: filter circuits for connection at the point of entry of the mains.

course is that the chokes which will generally be needed must be of lower resistance than those used in a receiver filter, as they have to pass much heavier currents.

Simplified Aids to Better Reception

No hard-and-fast rules were laid down as to the best type of filter for all circumstances, and it was suggested that experiments should be made with the various circuit arrangements shown in Fig. 1 (reproduced from a Post Office leaflet).

The simplest arrangement, consisting merely of two condensers joined in series across the mains input, and with the junction point earthed, does not introduce any complications. But, as already inferred, where chokes are necessary the greatest care must be taken to avoid an excessive loss of voltage, and before setting to work a rough estimation should be made of the maximum amount of current consumed for domestic purposes. In a small house, where no more than half a dozen 60-watt lamps and the wireless set are in use simultaneously, the total consumption will not exceed some 2 amps., assuming a normal voltage. It is not difficult to wind a pair of chokes with a total resistance of between 0.5 and 1 ohm, and so the loss of voltage should not exceed 2 volts, which is negligible. The Post Office suggests chokes of between 100 and 600 microhenrys inductance, and condensers of 2 mfd.

Chokes of suitable inductance, combined with a D.C. resistance low enough for most domestic installations, may be wound with No. 18 D.C.C. wire, and with a mean diameter of from 2in. to 3in. Between about 100 and 200 turns will be required, depending on the nature of the interference, etc., and the larger windings are most conveniently made up in "pancake" form. Where the load is heavy, a correspondingly heavier gauge of wire should be used for the chokes.

MOST amateurs have a high grade moving-coil D.C. voltmeter, but few feel inclined to incur the expense of buying an instrument for measuring A.C. voltages. For equal accuracy, the A.C. instrument is considerably more costly, and further, it is seldom that it becomes really necessary. It is not generally known that, without any internal alterations, and without affecting its normal use, a D.C. voltmeter may be converted for reading A.C. with very fair accuracy.

An Improvised A.C. Voltmeter

The modification shown in Fig. 2 is suggested for this purpose; assuming the meter to have a very high resistance—in the order of 1,000 ohms per volt—results will be quite satisfactory. Nothing is needed for the conversion beyond a valve holder, a low-tension battery, and practically any type of valve that may be available. It matters little if the valve has partially lost its emission, and is therefore unsuitable for normal use.

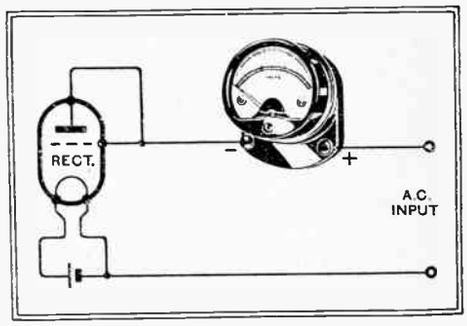

Fig. 2.—In order to read A.C. voltages on a D.C. voltmeter, a rectifier may be inserted in series.

To take a reading, the source of A.C. voltage to be measured is joined across the input terminals, and the voltage indication given by the meter is multiplied by a correction factor of 2.2 to ascertain the R.M.S. value.

An old-type Weco dry-battery valve is almost ideal for this purpose, as its filament may be heated from a single dry cell, thus overcoming the difficulty of maintaining an accumulator when the set itself is mains operated. If desired, of course, an ordinary 2-volt 0.1 amp. valve may be heated by means of two dry cells, with a series rheostat of 20 ohms.

IN an attempt to conserve anode current in Class "B" battery sets as much as possible it is quite usual to over-bias the driver valve in order to keep down the current flowing in its anode circuit to the lowest possible level. It would seem that sometimes matters are carried rather too far in this direction, with the result that distortion is produced.

Check the Driver Valve.

The purpose of this note is to point out that the operating conditions of the driver may be checked in the same way as those of a conventional output valve. A milliammeter, connected in the anode circuit, should show a steady current reading while signals are being received; violent kicks during the reproduction of loud passages will indicate overloading, and if they are in an upward direction we have an indication that the driver bias is excessive.

READERS' PROBLEMS

THESE columns are reserved for the publication of matter of general interest arising out of problems submitted by our readers. Readers requiring an individual reply to their technical questions by post are referred to "The Wireless World" Information Bureau, of which brief particulars, with the fee charged, are to be found at the foot of this page.

A.V.C. and Quality

THERE seem to be a few lingering doubts as to whether the use of automatic volume control is compatible with the highest quality of reproduction. Several correspondents have lately expressed doubts as to whether *pianissimo* and *fortissimo* passages will be rendered at their true values when A.V.C. is fitted.

We would hasten to assure them that their doubts are quite unfounded. A.V.C. is not out of place in a "quality" set; it does nothing to smooth out the normal variations in modulation, being operated solely by the average carrier-wave amplitude.

"Shorted" Volume Control

FOLLOWING conventional practice, a reader, who has built a "2-H.F." set for A.C. mains operation, is using variable-mu valves and has made provision for controlling volume by variation of grid bias.

After working well for some time, the volume control system has now failed, and, further, it is found that operation of the controlling potentiometer has no effect on the anode currents of either of the H.F. valves. Careful tests for insulation and continuity have been made with negative results, and so this reader has decided to ask our help.

As the circuits have been thoroughly tested, presumably with current switched off and possibly with valves removed, we can only think that the fault lies in one of the variable-mu valves, in which defective heater-cathode insulation has probably developed. A breakdown in the heater-cathode insulation of either valve would have the effect of short-circuiting the bias for both H.F. stages.

It is improbable that both valves have failed, and so, to detect the faulty one, we suggest that, with a meter in the common anode circuit, one of these valves should be removed while the set is working. If control of anode current can now be obtained by operation of the grid bias potentiometer, the valve removed is defective, while, if control is still unobtainable, the valve in the set will be responsible for the trouble.

Mains Periodicity

A CORRESPONDENT, who is using a metal rectifier in a voltage-doubling circuit, has noticed that the D.C. output of his H.T. supply unit is exceptionally high, and

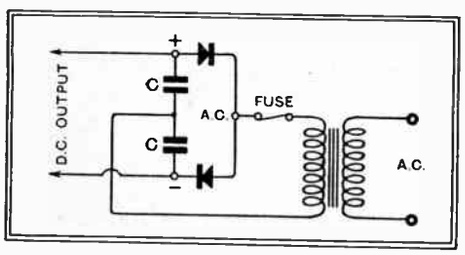

Fig. 1.—A conventional "voltage-doubler" circuit; the reservoir condensers C should be chosen with regard to the periodicity of the mains supply.

that a temperature rise takes place after a few minutes' work. He adds that his mains supply is rated at 80 cycles, and that the power transformer used is stated to be suitable for this periodicity.

It seems probable that this reader, who asks for a suggestion as to how his H.T. voltage may be reduced to a normal value, is using reservoir condensers of the usual capacity (4 mfds.) in association with his rectifier. These condensers (marked C in Fig. 1) are in series with the source of A.C. input; when current is supplied at an exceptionally high periodicity they will offer a lower reactance than at the more normal frequency of 50 cycles. According to the latest instructions issued by the makers of the Westinghouse rectifier, the standard capacity of 4 mfds. should be doubled for 25-cycle supplies, and halved for 100 cycles. These values are not critical, and we think that our correspondent might use condensers of 3 mfds. each.

Loading the Output Stage

THE prospective constructor of a modified version of the New Monodial receiver asks whether it would be possible to omit the intermediate L.F. stage, and to feed a single output valve, giving 5 watts, directly from the double-diode-pentode second detector.

This plan is not to be recommended, for the reason that it would involve the sacrifice of tone correction, which is an important feature of the set. With a tone-correcting coupling in its anode circuit, the D.D./PEN. second detector will certainly not give sufficient output without an intermediate stage, but it could be made to do so by substituting an anode load to about 20,000 ohms.

Superhet Tests

SUPERHETERODYNE receivers are not prone to H.F. instability; that is one of the attractions of the system. Nevertheless, occasions sometimes arise, just as in straight sets, where the signal-frequency H.F. stage of a superheterodyne breaks into uncontrollable self-oscillation, especially at the lower end of the waveband.

A reader whose set is behaving in this way concludes, quite rightly, that the cause of instability may most easily be localised by isolating the part of the receiver concerned. He proposes, for purposes of test, temporarily to convert the set into a simple H.F.-det. combination by inserting a pair of phones in series with the first detector anode. As the set is mains-operated, with quite a high anode voltage, it is considered desirable, in the interests of safety, to isolate the phones from the source of H.T., and our advice is sought on this point.

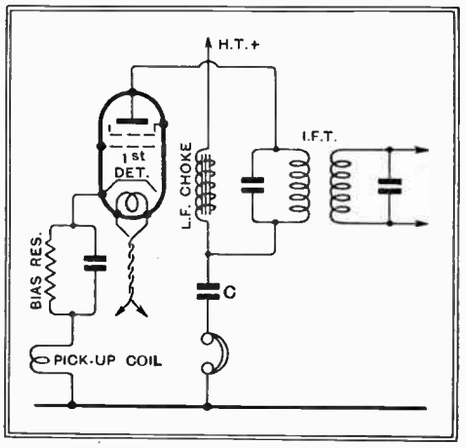

Fig. 2.—Temporary phone connections for testing a mains-operated superheterodyne.

Although one can often do it with impunity, it is risky to connect headphones directly to a mains-operated receiver, and we consider our correspondent is wise to take precautions. Failing a spare output transformer, which may be used for the purpose even if it does not give accurate matching, we suggest the use of a choke-filter arrangement, as shown diagrammatically in Fig. 2. For a choke, almost any inductive winding, such as the primary of a discarded L.F. transformer, will serve, while the condenser may have almost any capacity from 0.1 mfd. upwards; it should be rated at at least the same working voltage as the other condensers in the receiver.

When making a test of this sort it is a good plan to make sure that the oscillator valve is not functioning, as otherwise misleading effects may be introduced if the circuits associated with this valve be tuned to a frequency that will give an audible note when beating with oscillations in the signal-frequency circuits.

Oscillator Tuning

SEVERAL readers have asked whether an ordinary ganged condenser (without specially shaped plates) may be used for tuning a superheterodyne receiver.

It is possible, by the use of a padding condenser of suitable capacity in series with the oscillator section of the condenser, to obtain sufficiently good alignment of the signal-frequency and oscillator circuits without the use of a special condenser. But the reception of the long waves presents a difficulty, as the capacity of the padding condenser needed will differ from that required for the medium band. This introduces complications in waveband switching, as it will become necessary to make provision for changing over the padding condensers for each band.

For padding purposes it is generally best in such cases to use semi-variable condensers, or one of these in parallel with a fixed capacity.

The Wireless World

INFORMATION BUREAU

THE service is intended primarily for readers meeting with difficulties in the construction, adjustment, operation, or maintenance of wireless receivers described in *The Wireless World*, or those of commercial design which from time to time are reviewed in the pages of *The Wireless World*. Every endeavour will be made to deal with queries on all wireless matters, provided that they are of such a nature that they can be dealt with satisfactorily in a letter.

Communications should be addressed to *The Wireless World* Information Bureau, Dorset House, Stamford Street, London, S.E.1, and must be accompanied by a remittance of 5s. to cover the cost of the service. The enquirer's name and address should be written in block letters at the top of all communications.

"Did you notice one of the radio journals says the 'Microlode' was probably the high spot at Radiolympia?"

"It certainly is a very far-reaching development in speaker technique!"

ACCURATE MATCHING AT LAST!

● 17 transformer ratios for really accurate matching to ANY power valve or pentode and 4 ratios for Class B or QPP *all available on one speaker* by a simple switch adjustment! ● Added sensitivity due to the 'Mansfield' magnetic system! Better balance through really accurate matching! The difference in performance must be heard to be believed.

'MICROLODE'

(Regd. Trade Mark)

Type PM4a - 42/- Type PM6 - 32/6

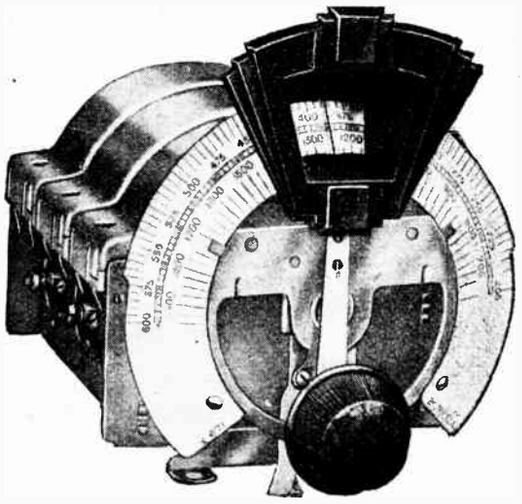
MOVING-COIL SPEAKERS

With the new Microlode feature and the famous 'MANSFIELD' magnetic system.

Write for the MICROLODE folder.

We are exhibiting at Stand No. 70, Scottish National Radio Exhibition, Glasgow.

Whiteley Electrical Radio Co. Ltd., Dept. W, Radio Works, Mansfield, Notts.



POLAR for SOUND DESIGN

FAMOUS SINCE 1922

SEND FOR NEW POLAR CATALOGUE

POLAR 'STAR' THREE GANG

Cadmium plated steel frame of rigid construction. Universal feet supplied permitting base or side mounting. Trimmers operated from top. Sections matched to within ½% or 1 mmfd. (whichever is greater). Bevelled scale, calibrated in degrees and wavelengths.

3 × .0005 Condenser only	**22/6**
" " with Moving Scale drive as shown	**27/-**
4 × .0005 Condenser only	**30/-**
" " with Moving Scale drive as shown	**34/6**

Can also be fitted with Full-Vision "Arcuate," "Horizontal" or "Semi-circular" drives.

NOTE. Super Het type 3 & 4 Gang condensers are available at the same prices shown above.

WINGROVE & ROGERS LTD.

188-9, Strand, W.C.2.

Telephone: Temple Bar 2244. Works: Old Swan, Liverpool.

POLAR 'UNIKNOB' TWO GANG

Steel Frame, Air di-electric trimmer controlled by knob fitted concentrically with tuning knob. Slow motion drive. Scale in wavelengths and degrees.

2 × .0005 - **18/6**

Can be supplied with either of the three Polar "Full Vision" Drives 1/3 extra.

MISCELLANEOUS ADVERTISEMENTS

NOTICES.

THE CHARGE FOR ADVERTISEMENTS in these columns is

12 words or less, 3/- and 3d. for every additional word.

Each paragraph is charged separately and name and address must be counted.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions 5%; 26 consecutive, 10%; 52 consecutive, 15%.

ADVERTISEMENTS for these columns are accepted up to **FIRST POST on MONDAY MORNING** (previous to date of issue) at the Head Offices of "The Wireless World," Dorset House, Stamford Street, London, S.E.1, or on **SATURDAY MORNING** at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26b, Renfield Street, Glasgow, C.2.

Advertisements that arrive too late for a particular issue will automatically be inserted in the following issue unless accompanied by instructions to the contrary. All advertisements in this section must be strictly prepaid.

The proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders and Cheques sent in payment for advertisements should be made ~~& Co.~~ payable to ILIFFE & SONS Ltd., and crossed ~~Notes being~~ untraceable if lost in transit should not be sent as remittances.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

PILOT AUTHOR KITS

Exact to Specification

NEW MONODIAL

RECEIVER KIT

Author's Kit of FIRST SPECIFIED PARTS for **RECEIVER PORTION ONLY**, less Plymax Chassis, Panel, Cabinet and Valves

Cash or C.O.D. Carriage Paid **£10-19-6**

Extra for **Peto-Scott Plymax Chassis** as used by the Author, 14" × 12" × ¾". **Ready Drilled and Assembled with Runners** **10 6**

Peto-Scott Oak faced Ply Panel, Ready Drilled, 14" × 10" **2 6**

RECEIVER KIT "A" as above but with PETO-SCOTT READY-DRILLED AND ASSEMBLED PLYMAX CHASSIS WITH RUNNERS AND PANEL, less Valves and Cabinet. Cash or C.O.D., Carriage Paid, £11-12-0 or Deposit £1-12-0, balance in 11 monthly payments of 20/-.

POWER UNIT KIT

Author's Kit of FIRST SPECIFIED PARTS for **POWER UNIT ONLY** but less Plymax Chassis and Valves

Cash or C.O.D. Carriage Paid **£8-13-6**

Extra for Peto-Scott Ready-Drilled Plymax Chassis with Runners, 18" × 6½" × ¾" ... **7 6**

POWER UNIT KIT as above but with READY-DRILLED AND ASSEMBLED PLYMAX CHASSIS. Cash or C.O.D., Carriage Paid, £9-0-0 or 12 monthly payments of 16/6.

SPECIAL OFFER

MAGNAVOX (Type 142) MAINS ENERGISED SPEAKER. Suitable for the **NEW A.C. MONODIAL.**

List Price £3-5-0. **OUR PRICE** **37/6**

Cash or C.O.D. Carriage Paid

FINISHED INSTRUMENTS.—Peto-Scott supply all "Wireless World" Sets as finished receivers. Aerial tested. Cash, C.O.D. or H.P. Send for quotation, no obligation. Peto-Scott have specialised in "Wireless World" Kits and finished instruments for 14 years.

BUILD your "Wireless World" Set on the PETO-SCOTT PLYMAX CHASSIS used and specified by the Author.

COMBINED KIT

Comprising Receiver and Power Unit Kits with 2 **Peto-Scott Ready-drilled Plymax Chassis with Runners and Peto-Scott Ready-drilled Oak Panel,** less Valves and Cabinet. Cash or C.O.D. Carriage Paid **£20-12-0**

or £3-12-0 Deposit and 11 monthly payments of 35/-.

COMPLETE KIT

Comprising Receiver and Power Unit Kits as Combined Kit but with Valves, less Cabinet. Cash or C.O.D. Carriage Paid **£27-17-0**

or £5-17-0 Deposit; Balance in 11 monthly payments of £2-4-0.

MODERN BATTERY FOUR

KIT 'A' Author's Kit of **FIRST SPECIFIED COMPONENTS** including ready-drilled ply-panel and Peto-Scott assembled and drilled **PLYMAX CHASSIS**, excluding Valves, Cabinet and Speaker. Cash or C.O.D. Carriage Paid **£8-6-9**

or 12 monthly payments of 15/3.

PETO-SCOTT PLYMAX CHASSIS SOLELY SPECIFIED. Plymax Chassis as specified by the Author, drilled and assembled 10" × 10". Cash or C.O.D. Post and Packing 1/3 extra. **7/6**

IMMEDIATE DELIVERY

NUMBERED ADDRESSES.

For the convenience of private advertisers, letters may be addressed to numbers at "The Wireless World" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Wireless World." All replies should be addressed to the Box number shown in the advertisement, c/o "The Wireless World," Dorset House, Stamford Street, London, S.E.1. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

☞ DEPOSIT SYSTEM.

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Wireless World," both parties are advised of its receipt.

The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50, 5/-. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.—Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

RECEIVERS FOR SALE.

NEW Monodial Amplifier Unit, assembled complete; £8/8.—7, Gravelly Hill North, Birmingham. [3411

MONODIAL, with A.V.C. and valves; £16; may be heard by appointment.—7, Gravelly Hill North, Birmingham. [3410

R.G.D. 701 a.c. Radiogram, superb instrument, almost new; bargain at £29.—"Riddlesden," Elm Av., Crosby, Liverpool. [3423

1933 Philips 830 C 4-valve all mains (D.C.), in perfect condition, 8 months old; cost £17/17, sell £8, or offer; call after 7.30 p.m.—5, Durlston Rd., Clapton, E.5. [3408

40/-.—Ediswan D.C., all-electric, S.G., det. and pentode, without valves, worth more to break up; transformers, output choke, 2.0005, with drum drives, coils, smoothing unit, resistances and condensers, etc.

£3/19/6.—Mains Radio 2-valve, A.C., with Ultra speaker, complete with valves unopened; list £8/10.—Kay, 167 City Rd., London, E.C.1. [3352

DEMON RADIO PRODUCTS.—Monodials built, converted, repaired, or kitted; official Wireless League repairers, fully equipped laboratory; estimates free, trade supplied.—White House, Rosehill Park West, Sutton, Surrey. Tel.: 4591. [3414

CIFEL D.C. 2-valve Sets, detector, pentode, Magnavox M.C., Osram valves, packed in makers' unopened cartons at £3/19/6, c.o.d., carriage paid; also Mavox D.C. 2-valve, detector, power, Sonochorde M.C., £3/12/6. W. Burns and Co., 237, City Rd., London, E.C.1. [3374

ARMSTRONG Latest Universal A.C., D.C. 4-valve Chassis, specially efficient S.G. circuit, pentode output, 75/-, with 5 valves 114/-; Armstrong 1934 Battery 3 chassis, metal construction, 2 tuned circuits, S.G., pentode output, built-in speaker, 45/-, with valves 69/-; above chassis have remarkable performance, 2 years' guarantee, approval.—Armstrong Co., 100, King's Rd., N.W.1. [3444

ACCUMULATORS—BATTERIES.

BATTERIES, fully guaranteed, 120 volts; 7/6, carriage paid.—Perrins, 69, Gower St., Birmingham. [3399

MAINS EQUIPMENT

N.P. Chargers for A.C. mains. Trade list free.

N.P. Have Most Efficient Chargers from 62/6, complete ready for use.

N.P. Have one or two Chargers Slightly Soiled at Bargain Prices. List.

N.P.—12-15v. ½ to 1 amp. Westinghouse rectifier, soiled, bargain 45/-; another, 35/-; also Tungar valve 15v. 3 amps., 85/-; Philips valve, 79/-; 7.5v. 6 amps., all variable from low amperage and in new condition, fully guaranteed; cannot repeat these bargains; list of others.

N.P. Have Motor-Dynamo 10 amps. complete, £6; Valve set 6 amps., £4; another, 40 volts, 2 circuits, 3 amps. and 4 amps., bargain, £8.—Nash Products, Ltd., Stechford, Birmingham, 9. [3433

TANTALUM for A.C. Chargers, H.T. and L.T.—Blackwell's Metallurgical Works, Ltd., Garston, Liverpool. [2139

A.C. Charging Plant, unused, cost £18/18, for £6/18/6; write for makers' specification.—Jersey, Cumnor Hill, Oxford. [3424

Mains Equipment.—Contd.

VORTEXION, Wimbledon, for 99.9% reliable transformers.

IF You Haven't Tried Them Yet Ask Someone who has, or call and inspect complimentary letters.

ALL Standard Models Delivery by Return; all secondaries centre tapped.

GUARANTEED 12 Months, and within 5% normal and 2½% super models, neat shrouding, with detachable feet, as used by Government Departments, etc., etc.

VORTEXION.—New monodial transformer, 200-250, 50 cycles, 425-0-425, 120 m.a., 4v. C.T. 3a., 4v. C.T. 1a., 4v. C.T. 1a., 4v. C.T. 6a., screen primary, open type, 20/-; shrouded, 22/-; super shrouded, 26/-; 10 henry choke, 5/6; 20 henry choke, 8/6.

VORTEXION.—Ferrocart III, 350-0-350, 60 m.a., 4v. 2.5, C.T., 4v. 3.5, C.T.; open type 13/6, shrouded 16/-; post 9d.

VORTEXION.—250-0-250, 4v. 1 to 2a., 4v. 2 to 4a.; open type 10/6, shrouded 12/6; post 9d.

VORTEXION.—Super model for H.T.8 or 9 or 10, 4v. 1 to 2, 4v. 2 to 4; open type 14/6, shrouded 16/6; post 1/-.

VORTEXION.—2½-watt Monodial A.V.C. model; open type 14/6, shrouded 16/6; post 1/-.

VORTEXION.—5-watt Monodial A.V.C. model, 400-0-400, 120 m.a., 4v. 6a., 4v. 3½a., 4v. 2, 4v. 1a., super screened; 20/-, shrouded 24/-.

VORTEXION.—350-0-350, 120 m.a., 4v. 2 to 5a., 4v. 2 to 4a., 4v. 2.5a.; open type 14/6, shrouded 16/6.

VORTEXION.—400 or 450 or 500v., 120 m.a., 4v. 2 to 5, 4v. 2 to 5, 4v. 2 to 5; open type 19/-, shrouded 23/-.

VORTEXION.—400 or 450 or 500, 150 m.a., 4v. 4a., 4v. 2.5, 4v. 2, 4v. 2, 4v. 2, core size 2¼in.×1¼in., a super job, 2% regulation; 35/- shrouded with terminals, less terminals, 30/-, open type 26/-; post 1/3.

VORTEXION Auto Transformers to B.E.S.A. Specification, 100, 110, or 120v. to 200, 220 or 240 volts, 60 watts, 7/3, post 9d.; 120 watts, shrouded 12/6, open type 10/6, post 1/-; 200 watts, open 14/6, shrouded 16/6, post 1/-; 500 watts 30/-, 2,000 watts £4/10.

VORTEXION 600-watt Transformers; £4/10, carriage free.

VORTEXION 30h. at 60 m.a. Chokes, 5/6; 40h. at 60 m.a., 8/6; 30h. at 150 m.a., 200 ohms, 10/6 open type, 12/6 shrouded.

VORTEXION 200v. 30 m.a. Eliminators, 110 or 220 input with 4v. 4a. winding; 37/6.

VORTEXION.—Transformers made to your specification. All standards in stock. 'Phone all hours.

HOYNE'S.—500-0-500v. 140 m.a., 4v. 2·4a., 4v. 4·6a., 4v. 2a., 4v. 2a.; 27/6, carriage 1/6; weight 12lb.

HOYNE'S.—0-110-135v. 90 m.a., 4v. 2·4a., suitable for H.T.6 or 7; 10/-, post 9d.

HOYNE'S.—200v. 200 m.a., 4v. 2·4a., 4v. 1·2a., suitable for H.T.8; 13/6, post 1/-.

HOYNE'S.—0-200-240v. 200 m.a., 4v. 2·4a., 4v. 1·2a., suitable for H.T.8 or 9; 14/6, post 1/3.

HOYNE'S.—Line transformers and chokes always in stock; we can also supply all components.

M. J. HOYNE, Offices and Works, 8a, Gladstone Rd., Wimbledon, S.W.19. Tel.: Liberty 3303. [3107

CABINETS.

RADIO-GRAM Cabinets; fully illustrated list free; remarkable values.—Gilbert, Cabinet Maker, Swindon. [1686

MANUFACTURER'S Clearance Lines of Cabinets for Radiograms, loud-speakers, and radio sets; hundreds to select from; send postcard for list; special: cabinets for Skyscraper and S.T.400.—H. L. Smith and Co., Ltd., 289, Edgware Rd., London, W.2. [3409

DYNAMOS, ETC.

ROTARY Converters, E.D.C. Co.'s manufacture, as new, D.C. to A.C., with output of 220 watts.—Apply Electricity Works, Newquay, Cornwall. [3335

ROTARY Converters, 220 volts D.C. to 200 volts A.C., capacities up to 0.44 K.V.A., cheap.—Milo Engineering Works, Milo Rd., East Dulwich, S.E.22. Sydenham 4422. [3225

ROTARY, converter (electro dynamic), filter, case, 230 d.c. (230 a.c., .391 amps.); £10; exchange mains receiver, 240 d.c.—Roydhouse, 28, Brownlow Rd., London, E. [3421

ROTARY Converters, 200/240 volt D.C. to 200/240 volt A.C., with smoothing and starter Crypto 440 Watts, £8/15; E.D.C. 120 watt, in silence cabinet, with smoothing, £7/10; Wates 180 Watt, as above, £7; all nearly new; others from £2/10.—Johnson Engineering, 86, Great Portland St., W.1. [3443

ELECTRIC DYNAMIC CO.—H.T. generator and charger, output 400 to 720 volts at 600 m.a., complete on slide rails, pulley and resistance meter and cut-out, used for 10 weeks only on Daily Mirror 8 tour, cost £20, sell £7, as new; also convertor, 110 volts in, 220 A.C. out, 400 watts Crypto, £5, also ton of P.A. equipment, including new valve, power, at half price.—Mobile Amplifiers, 6, Conduit St., W.1. [3435

GRAMOPHONES, PICK-UPS, ETC.

B.T.H. Cinema Type Pick-ups, brand new, 17/6, carriage paid, cash with order, or c.o.d. Send for list.—Ward, 12, Tredegar Rd., Bow, E.3. Tel.: Advance 3668. [3363

K.-B., brand new electric gramophone motors, Universal, 100-250 A.C., D.C., and clockwork, complete turntable autostop; list £6/15, 30/- cash with order, post free, or c.o.d.—45, Ellington Rd., N.10. [3432

LOUD-SPEAKERS.

P.M. Speakers Bargain.

LARGE Quantity 8¾in. P.M.M.C. Speakers, made by well-known manufacturer for set maker, highly sensitive, work off any set, 3-ratio transformer; 19/6, post free; money returned if not satisfactory.—Milton Manufacturing Co., Milton St., Coventry. [3415

B.T.H. RK Moving Coil Speakers, guaranteed new, unused, manufacturers' surplus, original price.

6 Guineas, highly sensitive and wonderful tone response, will handle up to 10 watts output, available for 6v., 100v., 200v. D.C., 30/-, also A.C. models.

£2/10; carriage paid, c.o.d., or cash with order; the best value in speakers obtainable to-day.—O. H. Seekamp, First Avenue House, High Holborn, London, W.C.1. 4th floor; office No. 582a. 'Phone No.: Holborn 6609. [1425

ROLA

the World's Finest Reproducers

If

you are building the "NEW MONODIAL" SUPER

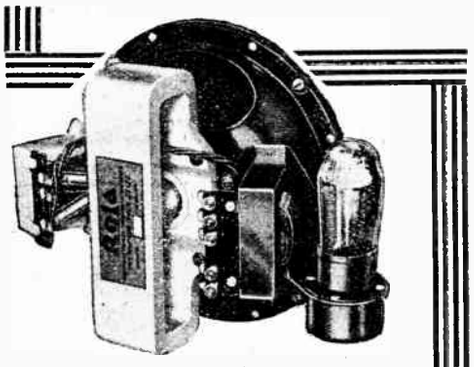
the Speakers Specified are

ROLA DUAL BALANCED PAIRS

Types F6-2500 & F7-2500 with 24B Transformer (Price £4) or ROLA Model F7-2500 with 24 Transformer. Price 47/6

If

you think of using any other speaker for this receiver, INSIST on your dealer demonstrating the above speakers before you decide.



ROLA CLASS B SPEAKER AMPLIFIER UNIT

If

you are a Battery set owner you can increase the volume and sensitivity of your receiver about 5 times in 5 seconds by connecting a Rola Class B Speaker Amplifier Unit.

PRICE (LESS VALVE) 57/- (Price with valve 71/-)

The British Rola Co. Ltd.

Minerva Rd., Park Royal, N.W.10.

ROLA SPEAKERS for better Radio Reception

Loud-Speakers.—Contd.

R. and A. "Victor" Loud Speaker; 45/-; very little used.—Montford, 62, Wheeleys Rd., Edgbaston, Birmingham. [3400

SENIOR R.K. 10in., 200-250 D.C., 50/-; Magnavox D.C. 144, 7.500, 17/6; O.P.M.4C. 8/-; O.P.3C. 8/-; Novotone J, 25/-.—45, Ellington Rd., N.10. [3413

10/-.—Lamplugh Silver Ghost, 2.200 ohms, with output transformer, unopened; list 47/6; c.o.d., carriage paid.—Kay, 167, City Rd., London, E.C.1. [3351

30/-!!!—B.T.H., R.K. moving coil speakers, 6in. cone, new and unused, guaranteed; these speakers are the type as used in cinema sound equipment; suitable for public address work; weight 3Clb., and are vastly superior to the cheap speakers now on the market, 100 volts, 150 volts, and 200 volts D.C.

27/6!!!—6-volt D.C. speakers, as above; £2/7/6 speaker as above for 100-250 volts A.C., complete with field rectifier.

THESE speakers are identical to Senior R.K., but for cone diameter; carriage paid, cash with order, or c.o.d.; send for list.—Ward, 12, Tredegar Rd., Bow, E.3. Tel.: Advance 3668.

CHAL ELECTRIC Offer New Boxed Set Manufacturers' Surplus Rola Speakers, all fitted hum buckers, state if Power or Pentode Transformer F6 110-175v. D.C. (2,000 ohms); 90-130v. D.C. (2,500 ohms); 150-200v. D.C. (4,700 ohms); 200-250 D.C. (6,500 ohms), listed at 35/-, at 18/-; F7 voltages as above list, 47/6, at 25/- each; permanent magnets F6P.M., listed at 49/6, at 28/-; F7P.M., listed £3. at 33/-; Ultra 95P.M., a real hefty job with Power-Pentode transformer, listed £4/15, at 47/6; Rola Dual Compensated (2) F6, list £3/10, at £2; (1) F6 and (1) F7, list £4/5, at 47/-; all goods Carriage Paid, Cash with Order, or C.O.D.—Chal Electric, 6, Conduit St., London, W.1. [3221

TRANSMITTERS.

QUARTZ Lenses, 2/6; guaranteed to oscillate without reaction.—Smith, Brynrodyn, Colwyn Bay. [3358

VALVES.

ALL Classes of Valves in Stock, including American and non-ring valves; send for price list.—R. Newman, 309, Roman Rd., London, E.3. [3446

ALL Types of Brand New American Valves in Stock, first class makes: 247s, 235s, 224s, 236s, 237s, 233s, 245s, 244s, 12/-, 227s, 226s, 280s, 245s, 9/6; 242s, 232s, 11/-; U.X.210s, 15/-; U.X.250s, 7 watts output, 16/-; 281s 14/6; post paid, cash with order or c.o.d. Send for valve list.—Ward, 12, Tredegar Rd., Bow, E.3. Tel.: Advance 3668. [3364

COMPONENTS, ETC., FOR SALE.

R. SELECTED Parts for Sale, as new, any c.o.d. or "Wireless World" deposit system, which we recommend if in doubt as to the splendid value offered; we take risk of damage in transit to customers; goods tested for callers and guaranteed.

METERS, moving coil, made for Ryall's Radio, guaranteed one year, and to B.E.S. first grade specification, all panel flush type, bakelite case, 0-1 m.a., 25/-; 0-5 m.a., 0-20 m.a., 0-50 m.a., 0-150 m.a., 21/- each; 0-250v., 32/6; 0-300v., 35/-; 1,000-ohm per volt, zero adjuster, size 3¼in.

METERS, as above, moving iron, first grade, air damped, zero adjuster, 0.250v. A.C., 18/-; 0-50 m.a. A.C. and D.C., 15/-; non damped, without zero, 0-12v., 10/-; 0-250v., 12/-; 0-3 amps., 10/-; 0-20 m.a. A.C. and D.C., 10/-; 0-50 m.a., ditto.

SUITCASE Type Cases, in best crocodile leather, 14×14 ×8, ample room for 12in. turntable and pick-up, 15/-; set cabinets for 3v. A.C. sets, room for speaker, good appearance, 15/-.

FERRANTI 7-valve Superhet., complete, £9; B.T.H. Junior A.C. speaker, with corrugated cone, separate rectifier, 67/6; Epoch 99½ 6v., 47/6; Marconi speaker, early model, 6v., with transformer, splendid reproduction, 15/-.

T.C.C. 2 mf., 350v. working, 1/6; T.C.C. 1 mf. type 84, 1/3; T.C.C. 0.01 mica, type M, 1/-; T.C.C. 250v. working, 4×4, 4/9; ditto, 4×4×1×1×½, 5/9; T.C.C. 15 mf., 100v. working, electrolytic, 1/3.

B.T.H. Universal Senior Gramophone Motors, A.C. or D.C, new, complete with auto stop and all fittings; 55/-.

RYALL'S Mains Transformers, 250v. 60 m.a. 4v. 1 amp., 4v. 3 amp. 10/6, 350v. 12/9, H.T.7 10/6, H.T.8 12/9, 4v. 3·5a. L.T. 8/9; chokes, 20H. 120 m.a. 8/9, 25H. at 60 m.a. 6/9, resistance 260 ohms, 40H. at 100 m.a. 600 ohms 10/6; all other models available.

WE Hold a Large Stock of First Class Radio Apparatus, meters, resistances, condensers, heavy chokes, in addition to the goods advertised.

POLAR Star 3-gang Condensers, 15/-; with drive, 17/6; Polar Uniknob 2 gangs, with drive, 8/6; Radiophone 4 gangs, 12/6; with cover and drive, 17/6; Radiophone 4-gang superhet, type, screened, with trimmers, Radiopack type, 9/-, post 9d.; Lotus new 4 gangs, 15/-.

RYALL'S RADIO, 33, Chancery Lane, London, W.C.2 (nearest Tube, Chancery Lane; 'bus 67 passes door, or tram to Savoy St.). Holborn 3529. Open Saturday afternoon. Close 7 p.m., Saturday 6 p.m. Thursday closed all day.

R. [3416

PEPPER

OFFERS the Following Under Usual Money-back Guarantee; carriage paid over £2.

TELSEN Aces, 2/3; amplitors, 1/9; Pentode correctors, 1/6; tapped Pentode chokes, 4/3; output transformers 1/1; ditto Pentode, 4/9; ditto multi-ratio, 5/3; British-General ditto, 5/3.

FERRANTI O.P.3c, O.P.4c, O.P.M.5, 7/11; Varley O.P.P. input, 8/6; Marconi Ideals, 3/11; Lewcos L.F.T.5, 8/11.

R.I. Parafeeds, 4/3; Pentamus, 7/11; Hypercore chokes, 8/11; O.P.P. outputs, 8/6; above second-hand.

MAINS Transformers, super types, 400-0-400, etc., 22/6; 150v. 300 m.a., with L.T.'s, 8/11; ditto, stripped, no L.T.'s, 7/6; ditto, H.T.8, 7/6; ditto, H.T.7, 6/6; Mullard L.T. transformers, 6/3.

PREMIER SUPPLY STORES Offer the following Set Manufacturers' Surplus New Goods at a fraction of the Original Cost, all goods guaranteed perfect, carriage paid over 5/-, under 5/- postage 6d. extra (Ireland, carriage forward)

ELIMINATOR Kits, including transformer, choke, Westinghouse metal rectifier, T.C.C. condensers, resistances and diagram, 120v. 20 m.a., 20/-; trickle charger 8/- extra; 150v. 30 milliamps, with 4v. 2-4 amps. C.T., L.T. 25/-; trickle charger 6/6 extra; 250v. 60 milliamps. with 4v. 3-5 amps. C.T., L.T. 30/-; 200v. 100 milliamps. with 4v. 3.5 amps. C.T., L.T. 49/6: 300v. 60 milliamps. with 4v. 3-5 amps. C.T., L.T., 37/6.

ELLIOTT First Grade Moving Coil Meters in the Following Ranges:—0-10, 0-30, 0-50, 0-100, 0-150 milliamps., also 250v. flush type, 17/6, projecting 15-/-.

ROLA Moving Coil Speakers, complete with humbucking coils and output transformer; please state whether power or pentode required; F6. 2,000 or 6,500 ohm, listed 35/-, at 17/6 F7. 2,000 or 6,500 ohm, listed 47/6, at 23/6; A.C. conversion kit for any of above, 10/-.

SPECIAL Offer.—Reisz type microphone with transformer, a really professional job, listed at £12; our price 52/6.

HEAVY Duty Variable Resistances, wound on porcelain, 2,000 ohms 1-4 amp., 5,000 ohms 1-2 amp., 120 ohms 1 amp., all the above values, 3/6 each.

T.C.C. Condensers 750v. working, 2 mf. 3/6, 4 mf. 6/-, 4 mf. 400v. working 4/-, 250v. working 1 mf. 1/-, 2 mf. 1/9, 4 mf. 2/6, 1,500v. working Standoff insulators .5 mfd. 1/6, 2 mfd. 6/-, aqueous electrolytic 440v. working, 4 mf. 3/-, 8 mf. 3/6.

DUBILIER Condensers.—.01 mica 6d., .01 mica 1,000v. working 1/-.

ALL the Following Lines 6d. each or 5/- per dozen: 4 and 5 pin chassis mounting valve holders; shielded screen grid or pentode leads 1-watt wire end resistances, any value; T.C.C. .1 condensers; hum dingers; on-off switches pushpull; polar ganging devices.

FERRANTI Condenser Blocks 300v. working 4—4—2-2, all separate, 5/-.

POLAR 3-gang 0.0005 Condensers, split end vanes, totally screened, disc drive; 6/11.

AMSCO Triple-gang 0.0005 Condensers, with trimmers, 4/11.

ORMOND 0.0005 Condensers, 1/3; 2-gang semi shielded, 2/6.

WESTERN ELECTRIC Mains Transformers, input 200-250 volt, output 500-0.500 volt, at 150 milliamps., 4v. 4a., 4v. 2.5a., 4v. 2a., 4v. 1a., 4v. 1a., massive job; 19/6.

T.C.C. Electrolytic Condensers, 10 mfd., 100 volts working, 1/-; 15 mfd. 1/3.

SPECIAL Offer of Mains Transformers manufactured by Philips, input 100-115v. or 200-250v., output 180-0.180 volts, 40 m.a., 4v. 1a., and 4v. 3a., 4/6; 200-0.200v., 4v. 1a., 4v. 3a., 4/6.

ALL Premier Guaranteed Mains Transformers have engraved terminal strips with terminal connections, input 20-250 volts, 40-100 cycles, all windings paper interleaved.

PREMIER H.T.8 Transformer, 250v. 60 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 25/-.

PREMIER H.T.9 Transformer, 300v. 60 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26/-.

PREMIER H.T.10 Transformer, 200v. 100 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26/-.

PREMIER Mains Transformer, output 135v. 80 m.a., for voltage doubling. 8/6; 4v. 3-4a. c.t. L.T. 2/- extra; Westinghouse rectifier for above, giving 180v. 30 m.a., 8/6.

PREMIER Mains Transformers, output 250-0-250 volts, 60 m.a., 4v. 1-2a., 4v. 2-3a. 4v. 3-4a. (all c.t.), with screened primary; 15/-.

PREMIER Mains Transformers, output 350-0-350 volts, 80 m.a., 4v. 3-5a., 4v. 2-3a. (both c.t.), with screened primary; 15/-.

PREMIER Mains Transformers, output 400-0-400 volts, 100 m.a., 4v. 4-5a., 4v. 2-3a., 4v. 2-3a., with screened primary; 15/-.

PREMIER Auto Transformers, 100-110/200-250 volts or vice versa, 60-watt, 7/9; 100-watt, 10/-.

SPECIAL Offer of Manufacturers' Type Transformers, any input, output 250-0-250 volts, 60 m.a., 4v. 1a., 4v. 3a. (both c.t.), 8/6; H.T.8 transformer, with 4v. 3-4a. (c.t.). 8/6; with rectifier, 18/6.

AMPLION Mains Transformers, input 100-250 volts, output 350-0-350 volts, 120 m.a., 4v. 5a., 4v. 2a., 6v. 1a. (all c.t.); 17/5.

FILAMENT Transformers, polished and engraved terminal boards, N.P. terminals, 4v. 3-4a., 5/-; 10v. 3a., 6/6; 12v. 1a., 5/-; 4v. 4-6a., 6/6; 14v. 4a., 6/6; 22v. 1a., 6/-; 6v. 2a., 5/-; 9v. 1a., 5/-; 35v. 3a., 15/-.

PREMIER Chokes, 40 m.a., 25 hys., 4/- 65 m.a., 30 hys., 6/-; 150 m.a, 30 hys., 10/6.

PYE Chokes, 20 or 32 hys., 4/-; Premier multi-ratio output transformers, giving 15 different ratios 7/6.

PREMIER Eliminators, input 200-250 volts, 40-100 cycles, A.C., incorporating Westinghouse metal rectifiers, output 250v. 60 m.a., S.G. and 120v. taps, 42/6; with 4v. 4a. c.t. L.T., 7/6 extra.

BRITISH RADIOPHONE Wire Wound Potentiometers, with mains switch incorporated, 5,000 ohms, 10,000 ohms, 50,000 ohms, 100,000 ohms, 250,000 ohms, any value; 3/6.

PREMIER Eliminators, output 150v. at 30 m.a., S.G., and 100v. taps, with 4v. 3-4a. c.t. L.T., 37/6; or with trickle charger, 42/6.

PREMIER Eliminators, output 120v. at 20 m.a., S.G., and 100v. taps, 27/6; with L.T. trickle charger incorporated, 35/-.

PREMIER D.C. Eliminators, output 120v. at 20 m.a., S.G. and 100v. taps; 15/-.

ACCUMULATOR Chargers, 200-250 volts A.C., all incorporating Westinghouse metal rectifiers; 2, 4, and 6v. at ½ amp., 12/6; 2, 4. and 6v. at 1 amp., 17/6; 12v 1a., 27/6; 6v. 2a., 35/-; 12v. 2a., 35/-; 12v. 1.5a., 30/-; 6v. 3a., 39/6· 30v. 3a., 42/6.

(This advertisement continued on next page.)

"Universal" Mains Valves

THE ONLY ones which operate direct from FULL MAINS VOLTAGE, either A.C. or D.C., without the use of transformers or resistances, and greatly reduce the cost of running your set. Do not confuse these with valves which can only be wired in series.

S 100.	S.G. valve for H.F. stages, L.F. couplings. Very high slope. Great amplification. Impedance over 1 million ohms	18/9
S 25.	S.G. valve for Det.—Audio and H.F. stages. High slope. Impedance 250,000 ohms	18/9
MS 18.	S.G. Vari-mu, with variable slope	18/9
MS 70.	S.G. Vari-mu. Excellent for A.V. control	18/9
D 130.	Outstanding characteristics: High-mu. Triode valve. Impedance 40,000. Amp. factor 100	17/6
PT 3.	Multi-grid valve. Very remarkable slope and high internal resistance	19/9
K 3560.	Output stage amplifying valve. Dissipation 15 watts. Amplification factor 3. Impedance 500 ohms. Remarkable scale of 6 mA. V.	25/6

Other types and rectifiers as previously listed all in stock. Details on request. Free Blueprint with first order.

Acoustically Perfect Cabinets!

The cabinets in which Celestion Moving-Coil Loudspeakers are housed are acoustically designed as ***part of the speaker*** and not only as an attractive article of furniture. As a result, reproduction over the whole range of frequencies is of the highest Celestion quality.

It is such ***attention to detail*** that puts Celestion in the forefront of modern loudspeaker design. The name Celestion stands for high-quality reproduction combined with unfailing efficiency. Celestion speakers can be supplied to match any set or type of output.

Ask your dealer for a demonstration, or write for full details.

The Very Soul of Music

THE FOREMOST NAME IN SOUND REPRODUCTION

Components, etc., for Sale.—Contd.

(This advertisement continued from previous page.)

AMPLION High Inductance Chokes, resistance 2,500 ohms, 80 henries 60 m.a.; 5/6.

WESTINGHOUSE Metal Rectifiers: 120v. at 20 m.a., 6/6; 180v. at 30 m.a., 8/6; 8v. at ½ amp., 6/6; 6v. at 1 amp., 9/5.

KOLSTER BRANDES Electric Gramophone Motors, complete with turntables and automatic stop, 100-250v., A.C. and D.C.; list price £5, to clear £2.

B.T.H. Induction Type (A.C. only) Electric Gramophone Motors, 100-250v.; 30/- complete.

AMPLION Moving Coil Speakers, type E.M.644, dual fields, 2,500 and 5,000 ohms (100 and 200v.), with output transformer, 12/6; A.C. conversion kit for this speaker, 10/- extra.

WESTERN ELECTRIC Condensers, 250v. working, 1 mfd. 6d., 2 mfd. 1/-; 500v. working, 1 mfd., 1/-.

T.C.C. Condensers, 250v. working, 4×4×1 mfd., 3/6; 300v. working, 4×4×2×2×2 mfd., 6/-; 6×4×2×2×2 mfd., 375v. working, 6/11; 4×4×1, 6/-.

SPECIAL Offer of Wire Wound Resistances.—4 watts, any value up to 10,000 ohms, 1/-; 8 watts, any value up to 15,000 ohms, 1/6; 15 watts, any value up to 50,000 ohms, 2/-; 25 watts, any value up to 50,000 ohms, 2/6; 50 watts, any value up to 50,000 ohms, 3/6.

WIRE Wound Potentiometers, 15,000 ohms, 1/6; Centralab Potentiometer volume controls, 50,000 ohms, 2/-; wire wound Claro-tat Potentiometer, 50,000 ohms, 2/6; Colverstats, logarithmically wound Potentiometers, 6,000 ohms, 1/9.

FOR Callers only.—The following valves, guaranteed new:—

THE Last Few Western Electric 3211 D Valves. 10v. 3a. filament, 750-1,000v. plate, 50-65 m.a., impedance 3,500 ohms, amplification factor 12; cost £5; to clear at 15/-.

PHILIPS 328 Valves for L.T. Charging, 5/6; 329 Barreter lamps, 2/-.

HARLEY Pick-ups with arm and volume control; 12/6.

PREMIER SUPPLY STORES, 20-22, High St., Clapham, S.W.4. Macaulay 2188. Closed 1 o'clock Wednesdays, open to 9 o'clock Saturdays. Nearest Station, Clapham North Underground.

PREMIER. [3388

GILBERT INDUSTRIES' Parcels.

"A," "B," "D," and Condenser Parcels, as advertised in issues August 4th and August 11th, still available by return of post.

GILBERT INDUSTRIES, Ltd., 519, London Rd., Westcliff-on-Sea. [3283

MILDMAY RADIO EXCHANGE Offers the Following, sound and perfect.

RADIOPAX, 35/-; Lewcos Band Pass filter, 6/6; A.W.C. chokes, 6/-; superhet. coils with pigtails, 4/6; O.S.C., 4/6; without pigtails, 4/-; frame aerials, Lewcos, 10/-; Varley Square Peaks, 5/6; Colvern K.G.R. coils, 5/6; Lissen 3-gang superhet. coils, 14/-.

WESTINGHOUSE H.T.1 Rectifier, with Rich and Bundy transformer, 30/-; R.J. E.735 mains transformer, 16/-.

MULTITONE Bepu, 1-1, 5/9; Toco, 9/6; second-hand Pentomite chokes, 9/6; Nicore I transformers, 9/6; Varley rectatone, 7/6; second-hand hypermu transformer, 8/6; and Pentamu outputs, 8/6.

A.C. Motors.—Garrard A.C.4, fully automatic plate and stop, 36/-; Collaro, pick-up and motor combined, type 32, 59/6; Collaro, less pick-up, fully automatic, 37/6.

FERRANTI B5 Chokes, 16.6; A.F.6, 16/-; A.F.3, 11/-; O.P.M.1, 10/-; O.P.M.1C., 14/-; O.P.3C., 12/-; A.F.7, 16/-; O.P.M.13C., 13/6; O.P.M.11C., 13/6; A.F.11c., 17/6; A.F.5c., 19/-.

KINGSTON Home Recorders, 5/-; Radiophone 2-gang, fully screened, 10/-; pair Rola Class B, matched P.M. speakers, 55/-; pair Rola D.C. matched speakers, 2,500, 30/-; Amplion M.C.6, 27/6.

ALL Carriage Paid; c.o.d. extra.

OPEN Thursday; closed Saturday all day.

CLISSOLD 5001.

24, Mildmay Grove, London, N.1. [3441

SOUTHERN RADIO Wireless Bargains.—Set manufacturer's guaranteed surplus:—

VARIABLE Condensers.—British Radiophone 4-gang superhet type, fully screened and trimmers, 0.0005, 8/9 (list 45/-). Same type, complete with dial knob and escutcheon, 12/9 (list 50/-). Hydra block condensers, new, 16 mfd., 2+2+8+2+1+1, 1,000 volt test (made for Canadian Marconiphone Co.), 8/9; 4 mfd., 2/6; 2 mfd., 1/9; 1 mfd., 1/-; all 750 volt. Polar 3-gang condensers, 0.0005, fully screened, complete trimmers, dial, knob, escutcheon; 11/-.

SPEAKERS.—Celestion Soundex permanent magnet, 16/- (list 27/6); Rola F6 permanent magnet, 28/- (listed 49/6); D.C. mains energised, 2,500 to 6,500 ohms, complete with humbucking coils and transformers, 16/6 (list 39/6); Peter Grassmann dynamic speakers and chassis, 10/6 each (list 35/-); G.E.C. Stork speakers, complete in magnificent cabinet, 19/6 (listed £3/15); Ormond speakers, complete in cabinets, 10/- (listed 25/-). Dr. Nesper Tefag speakers, 11/6 (listed 55/-).

CONSTRUCTORS' Kits.—Ready Radio "303" battery 3-valve kits, less valves, 18/- each; complete with 3 Mullard valves (P.M.1LF., P.M.2, 2D.X.), 33/- each (list 70/-); Ready Radio Meteor-screen grid 3-valve kit, less valves, 26/-; with 3 Mullard valves (P.M.12a, P.M.2D.X., P.M.2a), 49/- (list £5/7/6); Universal Radio 3-valve kits, ready assembled on chassis, 12/6 (listed 45/-).

READY RADIO S.T.400 Kits, as specified by Scott Taggart; £2/19/6 each (list £4/17/6).

READY RADIO Meteor Screen Grid 3-valve "A" Kit, complete with cabinet, permanent magnet speaker (less valves), £3/7/6, with 3 Mullard valves, £4/10 (list £8/17/6); Mullard Radio for Million 3-valve A.C. kit, complete with 3 Mullard A.C. valves (Pen. 4V. 354V. S.4V), £3/10 (list £6/10); Mullard Radio for Million 3-valve battery kits, complete with 3 Mullard valves, £3/3 (list £6/2/6); all kit brand new, in original sealed cartons.

BRITISH General Tuning Units.—Band Pass, 10 k.c., aerial or anode; 5/- (list 14/6).

SELENIUM CELLS. Light sensitive resistance, gold grids, moisture-proof. L to D ratio 5 to 1, 5/- each. Mounted in Bakelite, 7/6. Super Model in Oxy-brass body with window, 10/-.

PHOTO CELLS. £5 Photo Cells for Talkies, Light Tests, Timing Controls, etc., at bargain prices. Response to light 50 microamps. per lumen. 40 watt lamp, 75 c.m. King B.T.P., 15/-; R.C.A., 25/-; Holders, 1/-; Beck Prisms, 5/6; Focus Lens, 3/6.

TELESCOPES. Cooke monocular prism R.F., with 9-mile distance scale, 7½in. long, weight 3½lb., sale **17.6. Naval Gun Sighting Telescopes,** internal focus ring, 24in. long, 2in. dia., weight 6 lb., magnification 6, for short and long range. Cost £25. Sale, **17.6. Spotting Telescopes,** 17in.×1½in., by Watson, 25/-. 120 lb. Pressure Gauges 2/6. Watch movements, 1.6.

DIXMIPANTA, A.C. or D.C.

A small A.C. Test Meter that is really a **VEST POCKET TESTER.** A wonderfully versatile moving-iron, multi-range meter for service on A.C. jobs.

No projecting terminals. THREE ranges of volts: 0-7.5, 0-150, 0-300. Used for MILLIAMPS. reads 0-12½ m.a. and 0-75 m.a.

From Test Reports on the DIXMIPANTA:

Wireless World:
" . . . The accuracy with which voltage measurements can be made is surprisingly high, indeed, it could not be improved in view of the limitations imposed by the scale."

Popular Wireless:
" . . . one of the most attractive devices of its kind I have ever had come my way."
" It fulfils its purposes every bit as well as a whole team of separate and more expensive meters."

MICROPHONE BUTTONS for all purposes. 1/-. Volume Controls, 6d. Announcers' No. 11 Mikes, 5/6; Pedestal type, 18/6. Microphone Carbon Granules. In glass capsule, enough for four buttons. Grade No. 1, 8d.; No. 2, Medium, 1/-, No. 3, Fine, 1/6; Carbon, solid back, Blocks, 3d. Mouthpieces, curved or straight, 10d. Carbon diaphragm, 55 m/m., 4d. Panel Brackets, pivoted, 5/-. Reed Receiver Unit for Amplifier making, 3/-. Headphones, 2/9 pair. Veeder 10,000 Counters, 1/-. Leaflet with diagrams free if stamped envelope sent.

PARCELS of experimental odd coils, magnets, wire, chokes, condensers, switches, terminals, etc., post free. 10 lbs. 7/-, 7 lbs., 5/-.

1,000 other Bargains in New Sale List W.

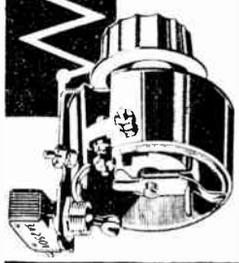
WATMEL

POTENTIOMETERS GIVE THE BEST CONTROL

It is obvious that if a firm concentrates on one type of component it is going to turn out a better job than a firm that dabbles in many. This year we are concentrating on potentiometers, and you may rest assured that when you purchase a Watmel potentiometer you are obtaining the very best from a firm that *specialises* in this type of component.



Here is illustrated the Watmel Type 1 Potentiometer.

Any resistance up to 50,000 ohms (Standard Wiring).

Price **5/6**

With quick break Switch

Price **7/6**

Please write for free fully illustrated catalogue that will give you interesting information on Volume Control.

Special models made for manufacturers and for the Export Market.
Please write for further particulars.

The
ELEMENTARY PRINCIPLES
of
WIRELESS TELEGRAPHY
and
TELEPHONY
by
R. D. BANGAY

Third Edition
Revised by O. F. Brown, B.Sc.
(1930)

THE standard book of instruction for wireless beginners and students. This revised edition brings the whole subject into line with modern developments in wireless. The style is clear and simple and attention is given to the theoretical elements of electricity and magnetism: to the dynamo: and to the properties of waves. A leaflet which gives full particulars of the volume, including a synopsis of the chapters, will be sent on request.

WHAT **"FREE-GRID"** THINKS OF THE

MODULA

ARMCHAIR CONTROL

"The volume control functions beautifully, the 'control' being spread nicely over practically the whole movement of the knob instead of crowded up at one end as in the case of some of them."—See page 192, Sept. 1st issue.

Controls the volume from a whisper to full volume. Fitted in a jiffy without tools. Does not affect the tone.

2'11
With Armchair Control 4/-.

DICTIONARY of WIRELESS TECHNICAL TERMS

Compiled by
S. O. PEARSON, B.Sc., A.M.I.E.E.
and issued in conjunction with
"THE WIRELESS WORLD"

Second Edition. Completely revised and brought up to date

This handy volume is very much more than a Dictionary. It not only takes the technical terms of wireless and explains their meaning, but in doing so it concentrates into a small space a large amount of information on wireless subjects. It has become, in fact, a compendium of current wireless knowledge, and an invaluable handbook for all who are interested in wireless transmission and reception. Diagrams and illustrations are freely interspersed throughout the book to amplify the explanations of the text.

NEW and Improved

Showing how condenser screws into base for easy fixing.

DUBILIER

PAPER CONDENSERS

This new range of type 9200 non-inductive condensers represents the latest design in Condenser Practice, and embody all the features essential to the Constructor who follows the modern "all metal" trend of design.

The method of fixing these condensers to the chassis which is exclusive to this type of Dubilier Condenser demands only the minimum of space and has been designed by engineers to give absolute satisfaction.

PRICES. 1mfd. 2/6; 2mfd. 3/6; 4mfd. 7/-

HERE ARE THE OUTSTANDING FEATURES

1. True non-inductive type of construction.
2. Available for working voltages from 300-900 D.C. peak.
3. Adequate factor of safety for each.
4. New method of fixing to chassis.
5. Aluminium containers with moulded bakelite top of distinctive appearance to match other components.
6. Takes up minimum amount of space on chassis.

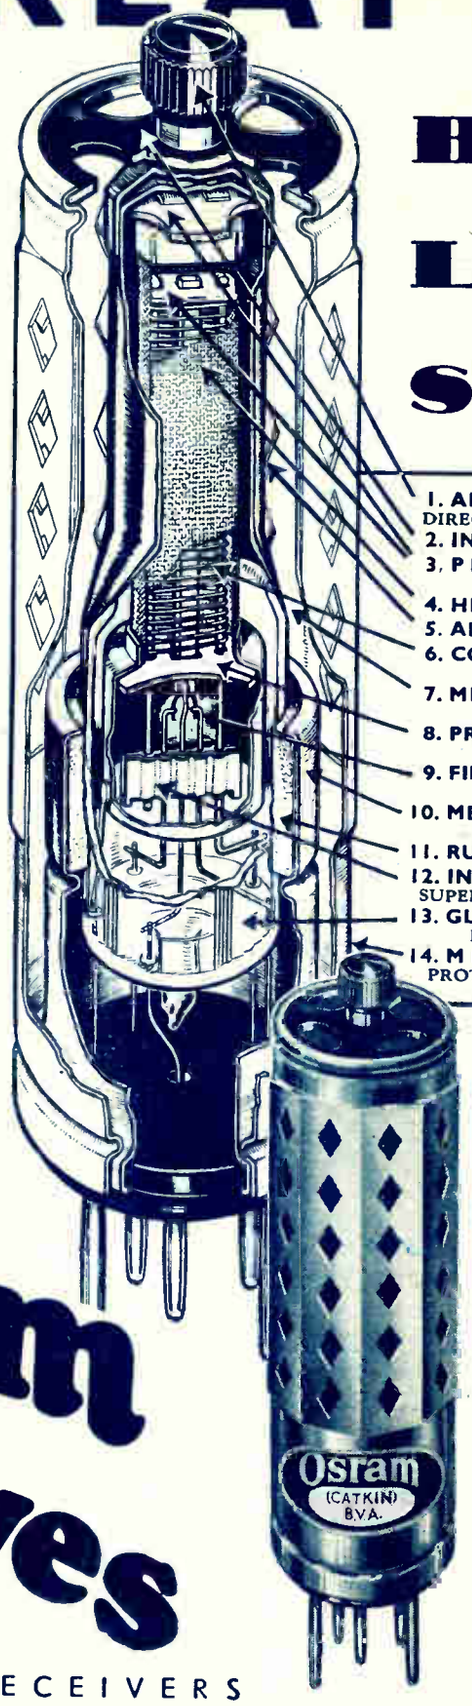
# of GREAT strength BUT LITTLE SIZE



1. **ANODE TERMINAL** DIRECTLY CONNECTED—LOOSE CAP IMPOSSIBLE
2. **INSULATION** BETWEEN ANODE & SHIELD
3. **PRECISION INSULATORS** LOCKING ELECTRODES
4. **HEXAGONAL SCREEN GRID**
5. **AIR COOLED ANODE**
6. **CONTROL GRID** STRAIGHT WIRE CONSTRUCTION
7. **METAL ANODE TO GLASS** VACUUM TIGHT JOINT
8. **PRECISION INSULATOR** LOCKING ELECTRODES
9. **FILAMENT CONNECTIONS** THE ONLY WELDS IN THE ELECTRODE SUPPORT SYSTEM
10. **METAL CAPPING SHELL** GIVING MINIMUM GRID—ANODE CAPACITY
11. **RUBBER MOUNTING** ANTI-MICROPHONIC
12. **INSULATED STEEL CLAMP** SUPERSEDING DELICATE PINCH OF GLASS VALVE
13. **GLASS CIRCULAR SEAL** GIVING MAXIMUM INSULATION SPACING BETWEEN WIRES
14. **METAL SHIELD** GIVING MECHANICAL PROTECTION AND ELECTRO STATIC SHIELDING

OSRAM "CATKIN" VALVES are essential for modern receiver practice. Immensely strong yet compact in design they are constructed to microscopically precise limits and therefore allow for greatly improved set performance. A set equipped with OSRAM "CATKIN" VALVES gives the highest quality reception.

The all-metal construction of OSRAM "CATKIN" VALVES is a radical departure and results prove beyond dispute that they definitely give more uniform results, complete freedom from microphonicity and more effective screening. A change to OSRAM "CATKIN" VALVES is a change to faultless radio reception.

100 tests with 8 turns of the knob...

The Sherlock Holme of Radio

"No instrument in the world makes all tests more easily than the Pifco ROTAMETER. Any component or circuit can be tested quickly and surely. Makes 100 tests. BRITISH MANUFACTURE.

RANGES:

1.—*0-8 volts. For low-tension voltage test.*
2.—*0-30 volts. For grid-bias voltage test.*
3.—*0-250 volts. For high-tension voltage test.*
4.—*BATTERY TEST.*
5.—*0-20 M.A. For individual valve test.*
6.—*0-100 M.A.* } *For testing current taken*
7.—*0-250 M.A.* } *by total valves in set.*
8.—*FILAMENT AND RESISTANCE TEST (4,000 ohms). For D.C. and rectified A.C.*

PIFCO ROTAMETER

Radio testing is revolutionised by the Pifco ROTAMETER. The key to its simplicity lies in the octagonal knob with its eight marked faces—"The Sign of Eight." The symbols on these faces give a range sufficient to test everything in radio. Just turn the knob for test desired, connect the part or circuit up to the ROTAMETER, and the result is there in the window of the instrument.

The Pifco ROTAMETER tests everything. Even itself! The BATTERY TEST registers the voltage of the three No. 495 radiometer cells inside the ROTAMETER. Another point about this wonderful instrument is the Safety Fuse which safeguards it against damage by careless handling.

Get your radio dealer to demonstrate the Pifco ROTAMETER to-day. If any difficulty, write direct to PIFCO, LTD., High Street, MANCHESTER, or 150, Charing Cross Road, London, W.C.2.

The ELEMENTARY PRINCIPLES
of WIRELESS TELEGRAPHY
and TELEPHONY
by R. D. BANGAY

Third Edition
Revised by
O. F. BROWN, B.Sc.

THE standard book of instruction for wireless beginners and students. This revised edition brings the whole subject into line with modern developments in wireless. The style is clear and simple and attention is given to the theoretical elements of electricity and magnetism: to the dynamo: and to the properties of waves. A leaflet which gives full particulars of the volume, including a synopsis of the chapters, will be sent on request.

W.W.97

DICTIONARY
of WIRELESS
TECHNICAL TERMS

Compiled by S. O. Pearson, B.Sc., A.M.I.E.E., and issued in conjunction with "THE WIRELESS WORLD"

SECOND EDITION
Revised and brought up to date

THIS handy volume is very much more than a Dictionary. It not only takes the technical terms of wireless and explains their meaning, but in doing so it concentrates into a small space a large amount of information on wireless subjects. It has become, in fact, a compendium of current wireless knowledge, and an invaluable handbook for all who are interested in wireless transmission and reception. Diagrams and illustrations are freely interspersed throughout the book to amplify the explanations of the text.

272 pp., bound in cloth boards
Size 5 by 3 inches

KINGS OF THE AIR

Improve the volume of those *"whispering"* stations

Those stations that you can only just hear—the ones that are mere whispers in the distance—they too can give you entertainment. Fit a Cossor Screened Grid Valve. You'll be surprised at the difference it will make — longer range, and a general all-round improvement. Your dealer will gladly advise you on the most suitable type for your receiver. Ask him to-day.

Cossor 2-volt Screened Grid Valves

Type	Fila-ment Amps.	Anode Volts	Imped.	Amp. Factor	Mutual Conduc-tance m.a./v.	Price
*215 S.G.	·15	120-150	300,000	330	1·10	15/6
*220 S.G.	·2	120-150	200,000	320	1·60	15/6
*220 V.S.G.	·2	120-150	110,000	—	1·60	15/6
*220 V.S.	·2	120-150	400,000	—	1·60	15/6

Cossor A.C. Mains Screened Grid Valves

Imagine it!

60 v. 5000 m.a.h. 14¾"×4⅝"×5¼" high 16lbs. 37/6

30 v. 5000 m.a.h 8⅞"×4⅝"×5¼" high 8lbs. 21/-

Now H.T. *accumulators*

half the size!

NO NEED NOW FOR DRY BATTERY EXPENSE

● A new era opens. Gone are the costly dry batteries. Gone are the bulky H.T. accumulators. To-day comes a new kind of H.T. source—a plate-less accumulator hardly bigger than the old dry battery itself. ● Startlingly low in first cost, it costs you nothing after except for occasional re-charging. The secret is the Block plate-less cell, that does away with the old weight, space and weakness of accumulator plates. ● Non-fragile. Elegant (the case is coloured bakelite). More durable than the plate type; inexpensive. Demand is overwhelming—order at once for early delivery.

MANCHESTER STAND 54

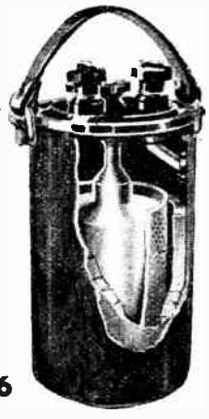
BLOCK

PLATE-LESS ACCUMULATORS

Block Batteries Ltd, Abbey Road, Barking, Essex. *Tel: Grangewood 3346/7*

DOUBLE CAPACITY L.T.

What a boon!



Cut away view of Block cell. — First the coloured bakelite that covers the L.T. type; next a lead cylinder (both the 'negative' and the cell's container.) Inside it, active paste. Last is the central 'positive' column and separator.

Price of L.T. 80 a.h. 2 v. 11/6

THE ADVANTAGES OF SUPERINDUCTANCE ARE PROVED BY THESE 6 FEATURES

1. Amazing sensitivity and selectivity. Four Superinductance tuned circuits. Precision methods of construction applied throughout the design.
2. Magnificent reproduction ensured by moving coil loudspeaker, carefully designed output stage and 3-position tone filter.
3. Simple 2-knob control. Absence of any oscillating circuit gives complete freedom from second channel and similar types of heterodyne whistles.
4. Automatic fading compensation and special selector control for quickly selecting the worthwhile programmes, and eliminating those spoilt by mush and background noise.
5. Easy station identification. Comprehensive station chart in conjunction with micrometer dial indicates the positions of nearly 100 stations with extreme accuracy.
6. The micrometer dial will not become obsolete when stations change their wavelengths. Revised charts will be supplied when necessary.

The 634 is another striking example of the success achieved by Superinductance. By means of this original method of set construction. developed exclusively by Philips for the reception of dual waveband broadcasting, the highest selectivity is ensured with complete freedom from heterodyne interference, absolute simplicity of operation and easy and accurate station identification.

For A.C. Mains. Type 634A.

100/260 volts, 40/100 cycles. 2 S.G.H.F.-Diode detector with S.G.L.F. Output Pentode. Valve Rectifier.

PRICE **16** GNS. or by 12 monthly payments of £1.1.6 each.

For D.C. Mains. Type 634C.

110, 150, 200/260 volts. 2 S.G.H.G.-Diode detector with S.G.L.F. 2 parallel Output Pentodes. Current regulator lamp.

PRICE **17** GNS. or by 12 monthly payments of £1.3.6 each.

We claim that model 634C is the finest receiver ever produced for operation on D.C. mains regardless of cost.

KIT "A" RECEIVER UNIT: Comprising the Designer's first specified components (less Chassis, Panel, Valves and Cabinet) - - - - - - - - **£10-19-6**

KIT "B" POWER UNIT: Comprising the Designer's first specified components (less Chassis and Valves) - - - - **£8-13-6**

Detailed Price List Free on Application.

ALUMINIUM CHASSIS correctly drilled with side members, finished in French-grey cellulose. Receiver Chassis, **10/-**; Power Unit Chassis, **7/6**. "C.A.C." Panel, 14" × 10", in Polished Oak, Walnut or Mahogany, **2/-**. Valves: Receiver (5), **£4-4-6**. Power Unit (4), **£3-0-6**.

FERROCART CLASS "B"

KIT "A." Complete (less Valves, Batteries, Cabinet and Loud Speaker) - - - **£7-11-0**

KIT "B." Complete with Valves (less Batteries, Cabinet and Loud Speaker) **£9-17-3**

KIT "C." Complete with Valves, Cabinet and Loud Speaker (less Batteries) - - **£13-9-3**

CABINET, beautifully finished in Figured Walnut exclusively specified by the designer and manufactured in our own factory - - - - - **£1-12-6**

(Front drilled, if desired, without extra charge.)

Continuous Demonstrations Daily.

CONSTRUCTION

We shall be pleased to undertake the construction of the above Receivers to customers' own requirements. Only highly skilled technicians, under the personal supervision of Mr. W. I. G. Page, B.Sc., are entrusted with this work. This ensures that the results obtained by the designer will be duplicated.

THE "C.A.C." PENTAGRID SUPERHET

A four-valve A.C. Superhet of highly specialised technique using a Pentagrid Converter as a single-valve frequency changer, which performs the dual functions of oscillator and first Detector in the most efficient manner known. In the I.F. stage a variable-mu Pentode is used, which adds its contribution to A.V.C. The third valve is one of the new double Diode Pentodes, which gives almost perfect automatic volume control, and the fourth valve is a Catkin Pentode. The output is in the order of 2½ watts, whilst the sensitivity of this Receiver is a revelation. The four special valves give an overall performance equal to that of any six-valve superhet on the market.

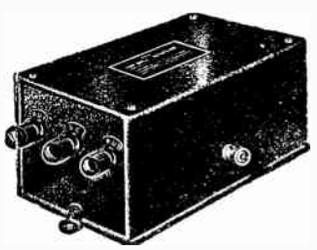
REALISM from RECORDS . . . is not a catch phrase designed to persuade the public to buy a component of doubtful value, but adequately describes the effect produced by fitting the 'NOVOTONE' Compensator to a Gramophone amplifier. These extracts from users' letters fully bear out this statement.

"I recently purchased a Type 'J' 'Novotone' Compensator for use in conjunction with a B.T.H. Pick-up and a Hartley-Turner Loudspeaker, and I am very pleased to say that results have exceeded all my expectations. I did not know that such results were possible in the electrical reproduction of records. . . . . I would like to take this opportunity of congratulating you on your excellent products.

"Upon fitting the 'Novotone' the results were most surprising. Moving Coil Speakers that we thought were the last word in purity on Radio Gramophone work, were improved beyond measure."

"I am more than delighted with it. It has brought notes out from my records that I had no idea were there."



Write now for free descriptive booklet, **"Realism from Records,"** which fully explains the application to your Radio Gramophone of this remarkable instrument.

EDITORIAL COMMENT

Aerials and Earths

Importance of an Overhaul

ALL of us have a natural desire to improve the standard of reception and are prepared to devote a large amount of time, and money according to our means, in doing all that we can to perfect our receivers. In the early days of wireless reception, when the simplicity of the crystal set left comparatively little scope for improving the efficiency of the receiver beyond a certain point, we paid the greatest attention to the aerial and earth because it was on this end of the outfit that we depended for any real improvement in reception.

Why Aerials Are Neglected

To-day, with the amazing amplification which the modern valve can give, and the efficiency of our receivers, we are inclined to think that the aerial and earth do not matter. A year or so ago, when the increase in the number and power of transmitters overtook the standard of selectivity in receivers, it was common practice to shorten the aerial, reducing its efficiency as a collector, as a means of improving selectivity of the set. Now, with set selectivity vastly improved, we would be prepared to wager that there are thousands of aerials which have been left precisely as they were, in spite of the fact that a new and up-to-date selective receiver has been installed in the meantime in place of the unselective one.

Wherever circumstances and space permit, a return to a long and efficient aerial would be found worth while to-day if a selective set is in use, and an indoor aerial, or any compromise of this nature, should only be entertained as an alternative if a good outside aerial is a physical impossibility.

In three weeks Summer Time will be at an end and very probably a wet spell will set in, so that the opportunity should be taken now for a thorough overhaul of the outside aerial and earth. From every point of view it will be found well worth the time spent.

Do It Well

Whilst on the job, put up the best aerial possible in the space available and then see how much difference it is going to make to reception. The earth, too, requires the same sort of overhaul, and, above all, watch for any rubbing contacts which may give rise to crackles which we may have hitherto regarded as inevitable atmospherics. Whilst the fine weather is still with us it is an opportunity, also, to consider whether it is advisable to install a screened down lead or other refinements. It is a job easily tackled whilst the fine weather lasts, but one to be shunned on a cold and wet day.

We should take the opportunity to discourage our friends from resorting to the use of "aerial substitutes" of pocket size, which, even in these enlightened days, are still being sold in a variety of types, in spite of the fact that their very dimensions are sufficient to preclude the possibility that they could act as efficient collectors. On the other hand, indoor aerials of good type and others of special design for outdoor use, will often be found to be the next-best-thing if outside aerial facilities are restricted.

On this question of aerials we should not be selfish, that is to say, we should, in our common interest of raising the standard of reception, encourage our friends, particularly those who are not technical, to take this opportunity to overhaul the aerial system or fit an outside aerial, if possible. We shall have the satisfaction of our friends' appreciation later of the value of the advice we give them now.

The Electrostatic Loud Speaker

1. How It Works

By M. G. SCROGGIE, B.Sc., A.M.I.E.E.

If a sufficiently high voltage were applied between the plates of a variable condenser, and the moving plates were sufficiently freely suspended, they would rotate into the maximum capacity position. In practice there is no great likelihood of our tuning dials moving round in this way when an extra powerful "atmospheric" arrives, because the friction at the bearings is so great that the voltage would spark across between the vanes long before being enough to shift them round. But the electrostatic voltmeter, which is simply a very tiny and lightly suspended variable condenser fitted with a pointer, demonstrates the truth of this principle every time it is used.

The principle, of course, is that a difference of potential or voltage between any two conductors causes them to attract one another, and, where they are free to move, to approach one another.

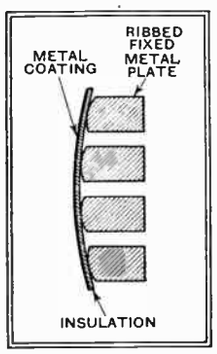

Fig. 1.—Section of the "Kyle" electrostatic loud speaker.

If the potential continually varies, the degree of attraction varies and the motion is continuous. A back-and-forward motion repeated at anything between about 16 and 16,000 times a second causes sound. Therefore, a condenser is, in principle at least, a loud speaker. Actually an ordinary paper fixed condenser may sometimes be heard to emit a faint note on being connected across the A.C. mains or other source of high alternating voltage. But generally the manufacturer has taken good care that the two strips of foil that make up the condenser are too tightly sandwiched between the waxed paper dielectric strips to vibrate at all.

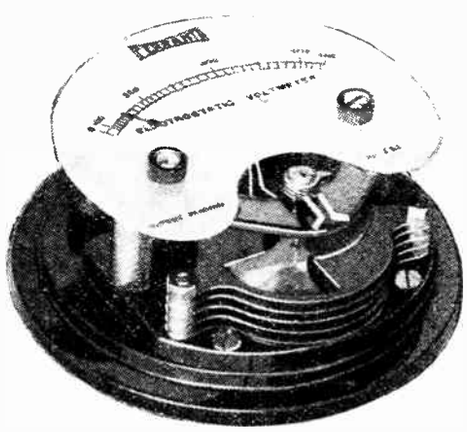
Practical Considerations

If a condenser is to be any good as a sound reproducer it should be exposed to the open air, and one at least of its two conducting elements should be reasonably free to move to and from the other. This could be done by suspending it a little distance away, with a layer of air in between. There are several disadvantages in this. The layer of air acts as a cushion, tending to damp out the motion, just as a pneumatic stop prevents a door from being slammed, however hard it is pushed. Then the force set up by a given voltage falls off very rapidly as the plates are separated even slightly. And to keep them separated at a fixed distance without solid material in between it is necessary to impede their free motion still further, either by making the plates very thick and stiff or by stretching them tightly.

The result is that the simple condenser loud speaker tends to be very inefficient and insensitive, and the object of design is to remove these objections. An example of the stretched diaphragm type is that by Hans Vogt, of Ferrocart fame. He used an extremely thin moving diaphragm, stretched so tightly, close to a perforated fixed plate, that the natural frequency was above the usual audio frequency range—about 15,000 cycles per second, in fact. The perforations were intended, of course, to remove the air damping.

THE amount of information which has been published about the electrostatic or condenser loud speaker is almost negligible. Being such an unknown quantity it has not yet come into general use, although it has been on the way for over fifty years. This neglect is not altogether deserved, for in some respects, particularly reproduction of the higher frequencies, it is unrivalled. Being fundamentally different from other types of loud speaker it is unfair simply to substitute it and expect the best results. The purpose of the author of this contribution will be to explain how the electrostatic loud speaker works and to give advice on its use.

The Kyle loud speaker—of American origin—has the effect of splitting up the total surface into a vast number of tiny diaphragms, by stretching the moving element directly on the fixed one, separated only by a thin layer of flexible insulation. Fig. 1 shows in section a small portion of this arrangement. The fixed plate is slotted and ribbed, and so shaped where it makes contact with the composite moving plate that an increase in voltage between them causes the latter to cling closer to the fixed plate and squeeze some of the air out through the slots. The reverse action takes place when the voltage relaxes.



The Ferranti electrostatic voltmeter illustrates the principle of electrostatic attraction.

A still closer approach to unrestricted motion is obtained in the "Primustatic" speaker, which, as it is one readily obtainable in this country, will be principally considered. Fig. 2 shows an enlarged section of it, in which the fixed plate, of perforated aluminium, is slightly curved. Behind it is a tinfoil-coated sheet of waxed paper, folded so as to form tiny triangular-sectioned air spaces behind the perforations. At the "dead" lines, in between the rows of perforations, where there is no motion, the foil paper is held in position by a special sort of hairy thread which makes very light, but adequate, contact everywhere. It is possible to use graphite-coated paper instead of metal, as a fairly high resistance does not interfere with the operation.

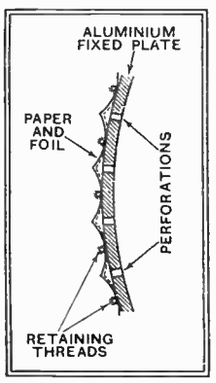


Fig. 2.—Section of the "Primustatic" loud speaker. The dotted line shows the position of the diaphragm under the force of attraction.

It will be clear that when a voltage is set up between the plates a sort of rolling action takes place, causing the line contact to spread out into a strip, as shown dotted, and air to be expelled through the perforations.

Possibilities of Distortion

As the attractive force takes place whenever a difference of voltage exists between the plates, it is obvious that they will move together during both positive and negative halves of an alternating wave. Thus, in Fig. 3, if (a) represents two complete periods of a 50-cycle supply, (b) represents the corresponding attractive force set up, and it will be seen that there are *four* complete waves. So instead of a 50-cycle note we get a 100-cycle note.

Reproduction in which every frequency is double what it ought to be is not likely to be considered satisfactory. It is interesting to note that precisely the same result is obtained in a moving-iron loud speaker or headphones in which no permanent magnetism is provided, the only

The Electrostatic Loud Speaker—

attractive force being due to the signal current. The remedy in the latter case gives us the clue to that for the electrostatic speaker defect—the provision of a steady initial force considerably larger than any due to the signal.

Fig. 3 (c) shows the combination of the high steady voltage and the alternating signal voltage, and one important feature is that it never reverses—the initial voltage being relatively large keeps it on one side of the base line throughout. Consequently the frequency-doubling effect is absent, and the attractive force closely follows the outline of the voltage, Fig. 3 (d).

The Polarising Voltage

It can be shown mathematically that not only is the distortion reduced to an unimportant quantity, but also the sensitivity is considerably increased. In practice it is not advantageous to increase the initial polarising voltage indefinitely, even if it were convenient. There would be the danger of breaking down the insulation—air or solid according to the type of construction—between the plates. Also the freedom of motion would be impaired by an excessive displacement in one direction. So the actual voltage is something of a compromise, and one is not far wrong in imposing the voltage used at the anode of the output valve. The signal voltage at this point is, of course, always substantially less. If the latter is stepped up, however, it may be necessary to increase the polarising voltage also, to make sure that it is in the correct proportion.

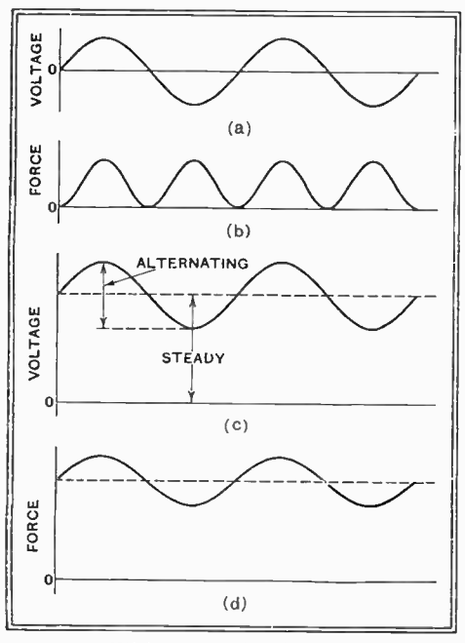

Fig. 3.—Without a polarising voltage, frequency doubling would occur in an electrostatic loud speaker.

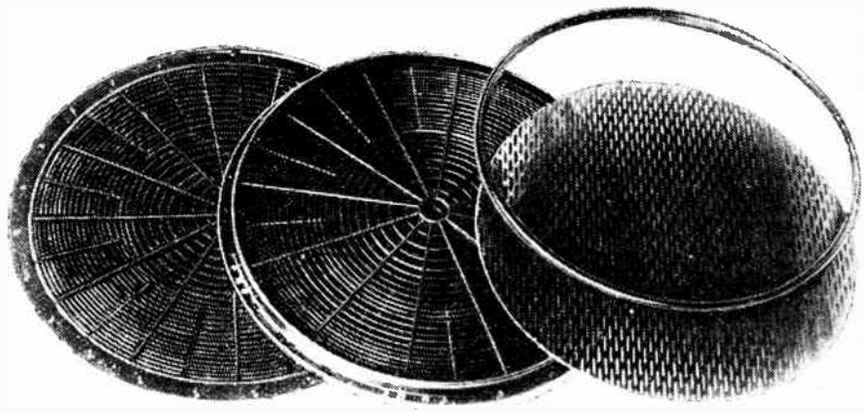
A polarising voltage of 1,000 used to be necessary for the earlier types, which is sufficient to explain the disfavour with which they were regarded for general use, and an advantage of the Primustatic type is that about 250 volts is usually enough. So what used to be a serious drawback now seldom presents much difficulty. The loud speaker being in effect a condenser draws no current from the polarising source.

A rather more serious criticism is that the amplitude of motion is not very great, and that there is therefore difficulty in obtaining strong reproduction of the lowest frequencies. This can be got over to some extent by increasing the area of the diaphragm, which can be done as much as one pleases by adding more units in parallel.



Component parts of the Vogt stretched diaphragm loud speaker.

Lastly, on the debit side of the account there is a problem in efficiently coupling the speaker to the output valve. This matter will be gone into in detail later.

High-frequency Response

Now for the credit side. It has already been pointed out that the high note reproduction is a strong feature. There are several reasons for this. Instead of the relatively heavy and complex moving system of any of the magnetic types of speaker, which renders it difficult to get upper frequency reproduction except in the form of resonances, there is a light uniform moving diaphragm, with extremely low inertia. Moreover, this is actuated all over its surface instead of at one part, as in other types, thus avoiding the complicated modes of vibration with resulting resonances and irregularities that distinguish the latter. Further, the area of the diaphragm can be made as large as one pleases, and the focusing and "interference" effects of a small cone are avoided. It is a better sound radiator, in other words. There is practically no upper frequency limit, and therefore it is in advance of present day microphones and transmitting systems, and advantage can be taken of any improvements in the latter. But even with existing standards of transmission, so long as local interference does not impose a severe limit, it is possible to appreciate a very greatly increased clarity and faithfulness of reproduction. It is significant that for special experiments in America, where substantially uniform output of sound was required up to 14,000 cycles, a condenser reproducer was employed.

The advantage is particularly marked in speech, string tone, and sounds involving transients, such as clapping, tapping, paper rustling, and cymbals.

The construction is much simpler than that of any other type. There are no coils, magnets, or field excitation. For the same reason it is extraordinarily light, and as regards compactness it can be made into panels of very little depth—an inch or so, for example, or even less if necessary.

An electrostatic loud speaker, used alone, is far superior in naturalness and clarity of speech to a moving coil speaker, particularly of the cheap sort now almost universal. But unless very large there is not enough depth to music to please most listeners, although even this deficiency can be made considerably more tolerable by the delightful distinctiveness of the instruments in the upper registers, which is variously described as brilliance, "life," and crispness. It is a great relief to get away from the thumpy whoofy reproduction that is so common, or the still commoner apology for "brilliant" tone produced by a fierce high note resonance.

The best overall reproduction is therefore given by a combination of moving coil and electrostatic speakers. To obtain a satisfactory distribution of labour between the two, or even to run an electrostatic on its own, we must consider how it behaves as a load in the valve circuit. Unless attention is given to this the results can be very bad indeed. So it will form the subject of the next part of this article.

Northern National Radio Exhibition

The Manchester Wireless Show will be held in the City Hall, Deansgate, from Wednesday, September 27th, to Saturday, October 7th, 1933.

Next week's issue will contain a plan and guide to all the Stands at the Show.

Practical HINTS and TIPS

IN a few cases it may be found that the special frequency-changing valve in the New Monodial receiver fails to oscillate over the whole of the medium wave-band. Assuming that the circuits are correctly wired and that the working voltages are normal, this effect must generally be ascribed to the fact that the particular specimen of valve in use has a somewhat lower mutual conductance than usual.

The Pentagrid Oscillator.

Although there are several ways of correcting this trouble, probably the simplest and most satisfactory cure can be effected by shunting the reaction section of the oscillator coil assembly with a fixed condenser of 0.0001 mfd. The coil terminals across which the condenser should go are numbered 1 and 2 in the diagrams published with the description of the set.

IT is probable that many readers have not noticed that, in the A.V.C. version of the original Monodial, a "free" supply of anode voltage for the control valve is obtained by the expedient of inserting the loud speaker field in the negative high-tension lead. This is a plan that might often be adopted when fitting a similar system of A.V.C. to existing receivers of the superheterodyne type; it is not suitable for "straight" sets, for the reason that a sufficiently high H.F. voltage is not available on the anode of the detector at the higher frequencies. The system of control is, however, useful when a straight set is employed in conjunction with a superheterodyne converter for short-wave work.

Free Volts for A.V.C.

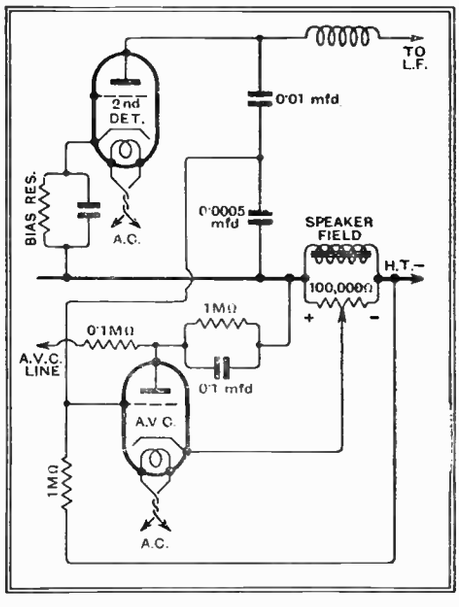


Fig. 1.—The voltage developed across the speaker field winding in the negative H.T. lead supplies the anode circuit of an A.V.C. valve; adjustment of grid voltage is made by means of a potentiometer.

AIDS TO BETTER RECEPTION

The essentials of the control system are shown in Fig. 1. By adopting this form of connection, correct working voltages will be obtained for the A.V.C. valve; its anode will be positive with respect to the cathode, and its grid will be negative with respect to the same point by an extent depending on the position of the potentiometer slider. This slider is provided in order that the working voltage of the A.V.C. grid may be set to a value which gives the correct amount of "delay" action; in practice it is easily adjusted by tuning in a very weak signal and then moving the slider gradually from the positive towards the negative end until a point is reached where signal strength begins to decrease. The slider is then moved back slightly towards the positive end; this will be the final working position.

The actual voltage existing across the speaker field is comparatively unimportant; 60 volts will give results, but a higher voltage is desirable.

FOR amateur use there is no more convenient method of coupling together two H.F. circuits than the "top-end capacity" system. As compared with methods which require adjustment of the relative positions of the coils, it presents no mechanical difficulties, and is therefore especially suitable for extemporising two-circuit tuners or filters when existing apparatus not specially designed for the purpose is to be used. Practically speaking, the only difficulties that are likely to arise are those brought about by imperfect screening and excessive minimum coupling; both have the same effect. It is therefore necessary to make sure that the coils used are properly screened, and that the coupling condenser which is joined between the high-potential ends of the circuit has a suitably low minimum capacity.

Capacity-coupled I.F. Filters.

Although this system of coupling is largely used in signal-frequency circuits, it does not appear to be generally realised that it is equally applicable to the I.F. couplings of superheterodynes—this in spite of the fact that it has been so used in several well-known receivers. As compared with arrangements in which the relative positions of primary and secondary coils may be changed, the capacity-coupled filter is probably easier to adjust and is certainly more suitable for those who, in spite of limited workshop facilities, are in the habit of making their own coils.

A capacity-coupled I.F. filter is shown diagrammatically in Fig. 2. For the coupling condenser CC, a semi-variable component of 50 micro-mfds. will be amply large enough; a condenser of 0.0001 mfd. may be used, but it is sometimes desirable to reduce its minimum capacity by cutting off a part of one of the plates. The decoupling resistance R and the associated condenser C may have normal values.

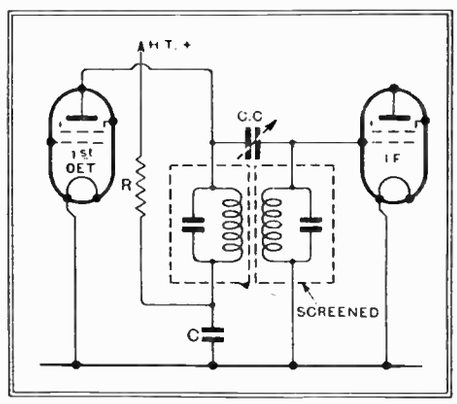

Fig. 2.—"Top-end" capacity coupling is as suitable for I.F. as for H.F. circuits.

THE main reason for the universal dislike to a background of mains hum is that it impairs the artistic value of the programme, gives a constant reminder that we are hearing an artificial reproduction, and is distinctly unpleasant to listen to for long periods.

Another Aspect of Mains Hum.

In addition to this, the existence of hum may actually have a prejudicial effect on the behaviour of the receiver. An output valve, or even a detector, which is partially loaded by hum potentials will not accept so large an input as one working under more ideal conditions.

It might be thought that if the intensity of hum be sufficiently great to load the valve to an appreciable extent the noise would be unbearably loud, but this is not always so in practice; if the hum frequency be above or below the normal band of frequencies reproduced at good strength by the loud speaker it is quite possible that it may not be audible at anything approaching its proper relative strength.

Similar remarks apply to interfering voltages produced by certain forms of man-made static, and in one case which was recently investigated it was found that the fittings of a proper mains filter, in addition to providing a quieter background, made a very obvious improvement to the sensitivity of the set. Admittedly, the detector used in this particular case was of the screen grid type, and able to deal with but a very small input without overloading, but the average detector has quite a small margin of safety.

DESIGN OF THE Detector-Oscillator

Precautions to Observe When a Single Valve is Employed to Serve the Dual Purpose

By F. R. W. STRAFFORD

THE frequency-changing device employed in all superheterodyne receivers generally presents the designer with his most difficult problem. Practically every case of failure to work or violent instability can be traced to this stage, particularly when a single valve is made to perform the dual function of providing the local oscillation, mixing it with the incoming preselected signal, and rectifying the resultant wave form to give the desired beat frequency or intermediate frequency.

The use of a separate valve for each function is often the most straightforward method of securing the optimum conditions for maximum heterodyne conversion, but the tendency of the manufacturer, as distinct from the builder of an individual set, towards reducing costs of construction and subsequent maintenance is a paramount factor in these days; and if the commercial designer can kill two scientific birds with one stone it is the course to adopt.

Bearing this in mind, the writer will attempt to elucidate the action of the detector-oscillator and describe how a single screened grid or H.F. pentode valve may successfully perform the requisite dual function if certain circuit precautions are observed.

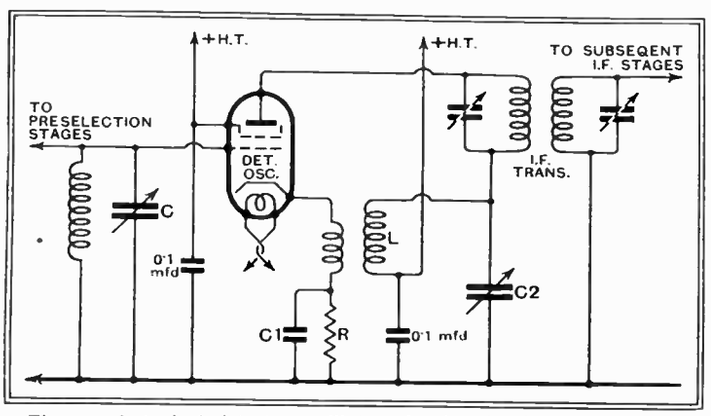

Fig. 1. A typical detector-oscillator circuit normally ganged. Condensers C, C2, are

Schematically, the simple detector-oscillator circuit is depicted in Fig. 1. Oscillations, the frequency of which are fixed by the LC circuit, are produced via the coupling coil in the cathode circuit, and the oscillating difference of potential set up between cathode and earth is applied to the grid, together with the signal from the preselector stage or stages.

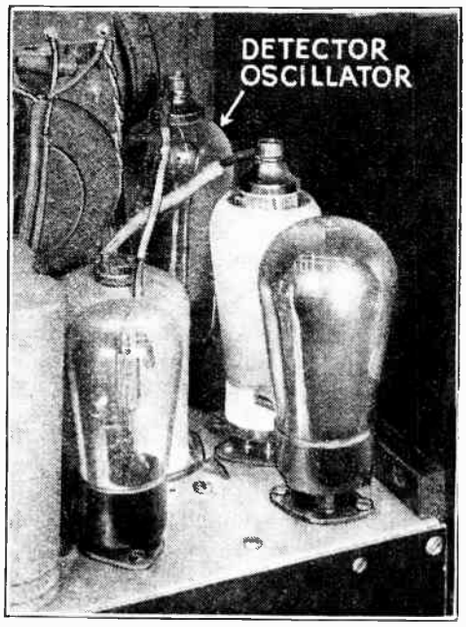
Even though oscillating, the valve is able to rectify these combined wave forms, although less efficiently than a separate detector, and the resultant intermediate frequency appears in the plate current components and sets up a resonant voltage across the intermediate frequency transformer. The apparent simplicity of the action, however, loses some of its appeal when the circuit is tried out unless great care is exercised in selecting the circuit constants.

Undesired Oscillations

It can easily be seen that, since there are two tuned circuits in the anode lead, there is every possibility of the circuit oscillating at an undesired frequency in the neighbourhood of the intermediate frequency. This often occurs—particularly when the dynamic impedance of the oscillator circuit is less than that of the intermediate frequency circuit. The condition may be cured by tapping the anode lead down the primary of the intermediate frequency transformer, thereby reducing its effective dynamic impedances as reflected into the anode circuit. Such an operation will naturally reduce the intermediate magnification, but in general practice this method of eliminating intermediate frequency oscillation will give the necessary suppression before much loss of magnification has occurred.

The desirability of employing an oscillator circuit with a high magnification has now been established from the viewpoint of stabilising the oscillation over the working frequency range. Another advantage is the reduction of oscillator harmonics transferred to the grid circuit; for it is known that when the preselection is not exceedingly high the small out-of-tune signals from a local transmitter produce a complex series of chirps by beating with these harmonics as the tuning condenser is rotated in search of stations.

Theoretically, the amplitude of the intermediate frequency is directly proportional to the product of oscillator and signal voltage, and it would therefore appear that the best operating conditions implied strong local oscillation. The assumption is, however, only true while the rectification continuously occurs on the *parabolic* portion of the anode current grid volts characteristic; when the valve has to perform the dual function of simultaneously oscillating and rectifying the conditions are altered, and the assumption no longer implies.



An H.F. pentode valve, the Mullard S.P.4, is employed in the detector-oscillator stage of the Varley "Square Peak" 4 Superhet.

Effect of Strong Oscillations

If the oscillations are too strong, first the violent grid current will damp the preselector circuit and increase also the reradiation of oscillator voltage via the grid cathode impedance, and, secondly, the rectification efficiency will fall, since the weak signal is, in a way, demodulated by the stronger oscillation.

Fig. 2 shows the approximate relationship between oscillator voltage and intermediate frequency output for a small input signal assumed to be constant.

It can be seen that a linear action does exist until a certain strength of oscillation

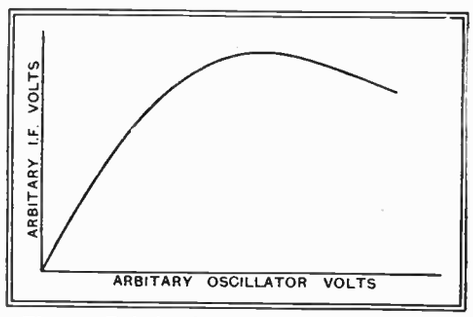


Fig. 2.—Relation between oscillator and I.F. voltage.

Design of the Detector-Oscillator—

is reached, and thereafter the rate of change rapidly decreases and finally reverses.

Experience has indicated that the best value for initial bias voltage (obtained via the cathode resistance R) and oscillator voltage between cathode and earth should be experimentally determined.

Using typical British A.C. screened grid valves or H.F. pentodes, at their normal voltage ratings, the bias resistance should be between 3,000 and 8,000 ohms, and the r.m.s. oscillator voltage across the cathode coil from 2 to 5 volts, and certainly not greater.

Effect of Coupling

The strength of oscillation is chiefly determined, for a given anode voltage, by the tightness of coupling between the reaction and oscillator coils, and the selection of suitable reaction conditions is very important. Tight coupling with few turns is better by far than loose coupling with many turns, although the mutual inductance may be the same in each case. For when the reaction turns are excessive the inductance of the winding may resonate with associated capacities and produce either spurious oscillations or "blind spots" over certain portions of the desired waveband, resulting in partial or complete loss of sensitivity. Even when few turns are used it is a good plan to wind the coil with resistance wire so that the reaction circuit losses effectively damp out any such tendencies.

In normal practice, a rough guide to the number of reaction turns required when tight coupling is used is as follows: For ordinary screen-grid valves operating at normal voltage ratings, approximately one-tenth of the oscillator coil turns, and for H.F. pentodes about one-twentieth.

When the oscillator-detector is directly connected to the aerial preselection circuits a certain amount of re-radiation of oscillator frequencies is unavoidable due to the grid cathode impedance, which is normally a capacity resistance. Great care should therefore be taken to keep any stray capacities, effectively in parallel with grid and cathode, at a minimum. Where the valve is metallised it is useful to remove the coating by scraping; or, better still, to employ the equivalent unmetallised version.

In most cases the clear valve is the better to employ, since the cathode is at H.F. potential above earth, and the metallising, which is connected to the cathode pin, will often produce queer "blind spot" effects by resonating with the reaction coil inductance.

There is still one very important function of the detector-oscillator with which it is proposed to deal. The intermediate frequency component passes through the reaction coil during its circuit from anode to cathode, and thereby sets up potentials across the grid-cathode circuit. These potentials are therefore amplified to some extent by the oscillating valve, and unless the phase is suitably adjusted the net result developed across the intermediate frequency transformer may show an appreciable loss in magnification.

By a judicious adjustment of phase, which may be carried out to a considerable degree by varying the capacity C1 across the cathode bias resistance R, the intermediate frequency may be reintroduced so that the anode circuit components are brought very nearly into phase. By this method the magnification or conversion factor of the detector oscillator stage may be increased several times. If the adjustment is carried out too far the inevitable occurs, and the stage flops into violent oscillation or squegging.

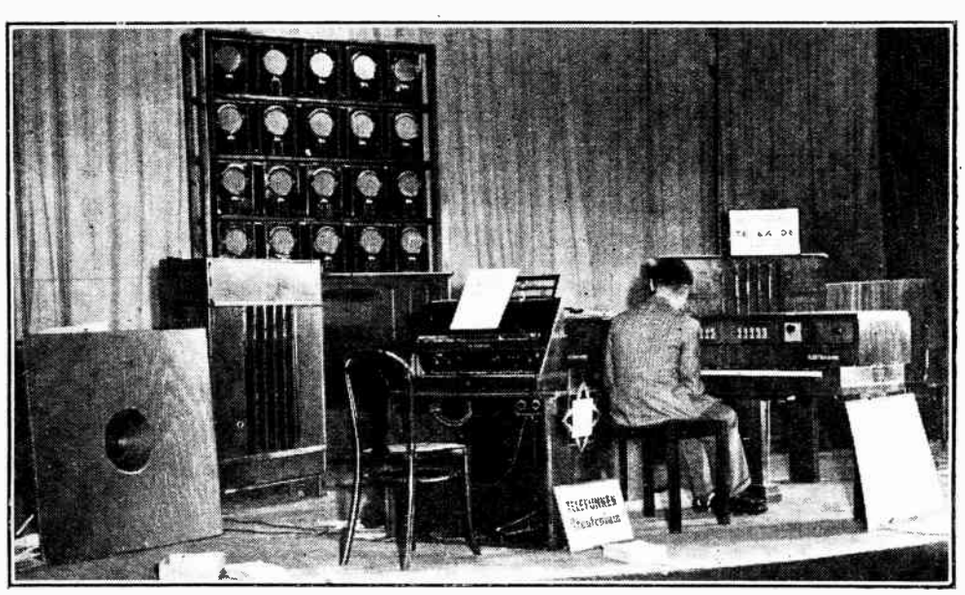
Summary

The important points in detector-oscillator design may be summarised as follows:—

(1) The use of a high magnification oscillator circuit reduces the tendency for unstable oscillation or sudden transference of oscillations to intermediate frequency.

(2) For normal screened grid or H.F. pentode valves the oscillating voltage across the cathode coil should lie between 2.0 and 5.0 volts r.m.s.

(3) The bias resistances should lie between 4,000 and 8,000 ohms, and the capacity between 0.001 and 0.005 μF. It is best to commence with some low limit of both resistance and capacity and finally adjust both for maximum stable magnification when the other circuit conditions are correct.



The Trautonium and other electrical musical instruments shown at the Berlin Exhibition. The Telefunken Company now manufactures the Trautonium to an improved design.

NEW BOOKS

Experimental Television. by A. Frederick Collins, F.R.A.S. Sir Isaac Pitman and Sons, Ltd. 313+xxii and 185 diagrams. Price 10s. 6d.

The title of this book would lead one to believe that it deals with the experimental side of television transmission or reception, but a glance at the chapter headings soon shows that it is concerned at least as much with optics and radio technique. Although they both play an important part in television they are themselves specialised subjects, and elementary descriptions of experiments with reflection, refraction, crystal detectors, and simple amplifiers are out of place in a book on television. A thorough knowledge of these subjects is undoubtedly necessary for a complete understanding of the problems of television, but there are many good text-books available which deal with them in a scientific manner.

Apart from matters of this nature, the book is by no means free from errors. On page 2 it is stated that "a molecule consists of two or more atoms," whereas, of course, molecules consisting of no more than a single atom are quite common. The errors in the circuit diagrams are too numerous to be listed here, but it should be noted that they consist chiefly of the omission of grid leaks and the connection of H.T. batteries in such a manner that they are short-circuited.

The author possesses a happy air of infallibility, and it is interesting to know that he has settled the vexed question of the exact composition of the ether! The book assumes no knowledge whatever on the part of the reader beyond the ability to read, and while this in itself may be a good point, in this case it results in a style which is reminiscent of a book for the very young.

The book is of American origin, but the English edition under review, which is well printed and bound, and free from typographical errors, is published by Sir Isaac Pitman and Sons, Ltd. W. T. C.

The Radio Trade Annual of Australia, 1933 (First Edition), compiled by the staff of "Radio Retailer of Australia" and containing a quantity of useful information concerning the progress and present position of wireless in Australia, including the general history of the industry during the past twenty years, the laws, regulations, and agreements now in force in the Commonwealth, list of national and private broadcasting stations, servicing, and technical data and other useful information. Pp. 247. Published by Australian Radio Publications, Ltd., Sydney. Price 10s. post free in Australia, or 12s. 6d. overseas.

YOU BE THE JUDGE

"I present to you

INCONTESTABLE EVIDENCE

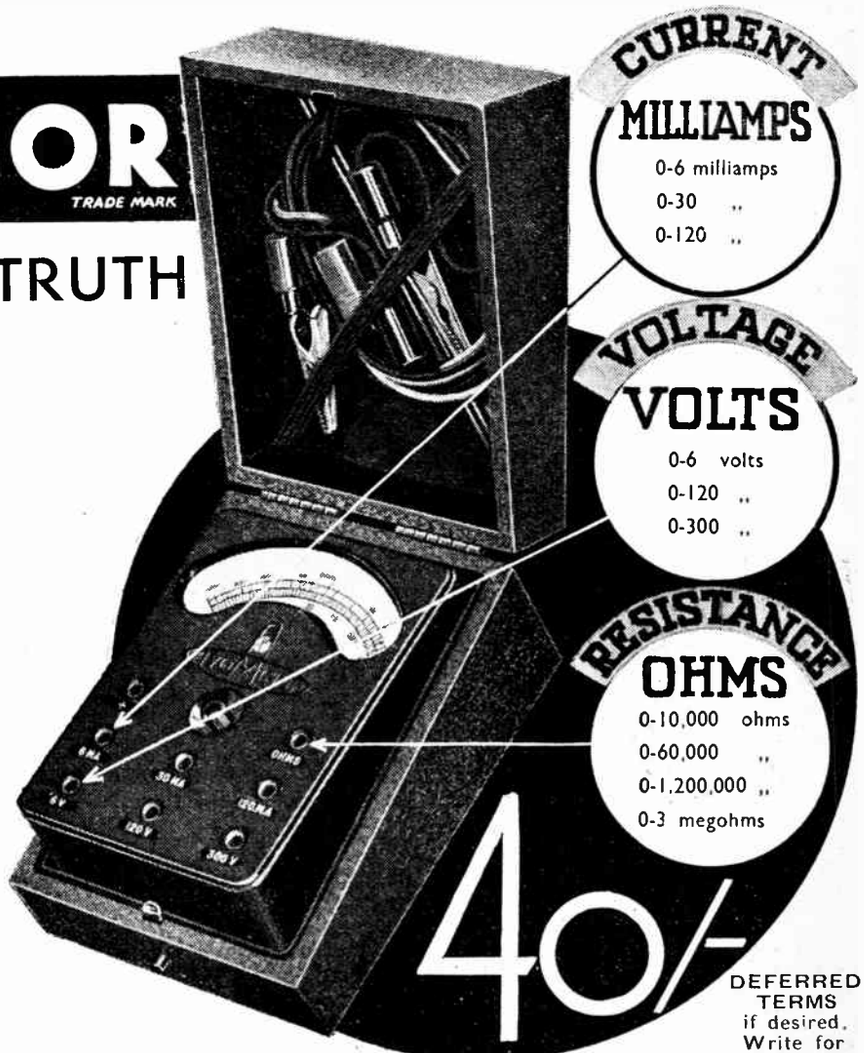
. . . I place before you the actual EVIDENCE of where your set is right or wrong. I am giving you conclusive and all-inclusive evidence of radio faults and efficiency. I give you—not just the circumstantial evidence of amperes, volts and ohms, no mere hypothesis, but proved and tested ACCURACY. I present the precision of the AvoMinor, a younger brother of the famous Avometer, the instrument that is so accurate and efficient that it is preferred and insisted upon by the world's foremost technical experts and service engineers. This in itself is evidence enough that nothing less than the AvoMinor is dependable enough for you.

The AVOMINOR TRADE MARK

TELLS THE WHOLE TRUTH

Now YOU can test YOUR set—examine it, locate the faults, get first-class results from it—with the ease and precision of the technical expert. You can test ACCURATELY with the AvoMinor—test circuits, valves, components, batteries and power units. There is no test you need that you cannot make with the AvoMinor. **It gives TEN *different* ranges of readings in milliamps, volts and ohms. It is a moving-coil combination testing instrument with a total resistance of 100,000 ohms. Full scale deflection is obtained with only 3 milliamps.** No other instrument in the world gives you, at such a convenient price, so many tests with such dependable accuracy.

Ask your radio dealer to show you the AvoMinor. Be satisfied with nothing less. Remember, it's accuracy that is all-important. In case of difficulty, write for fully descriptive folder.



DEFERRED TERMS if desired. Write for particulars.

Complete in handsome case with pair of leads and interchangeable crocodile clips and testing prods.

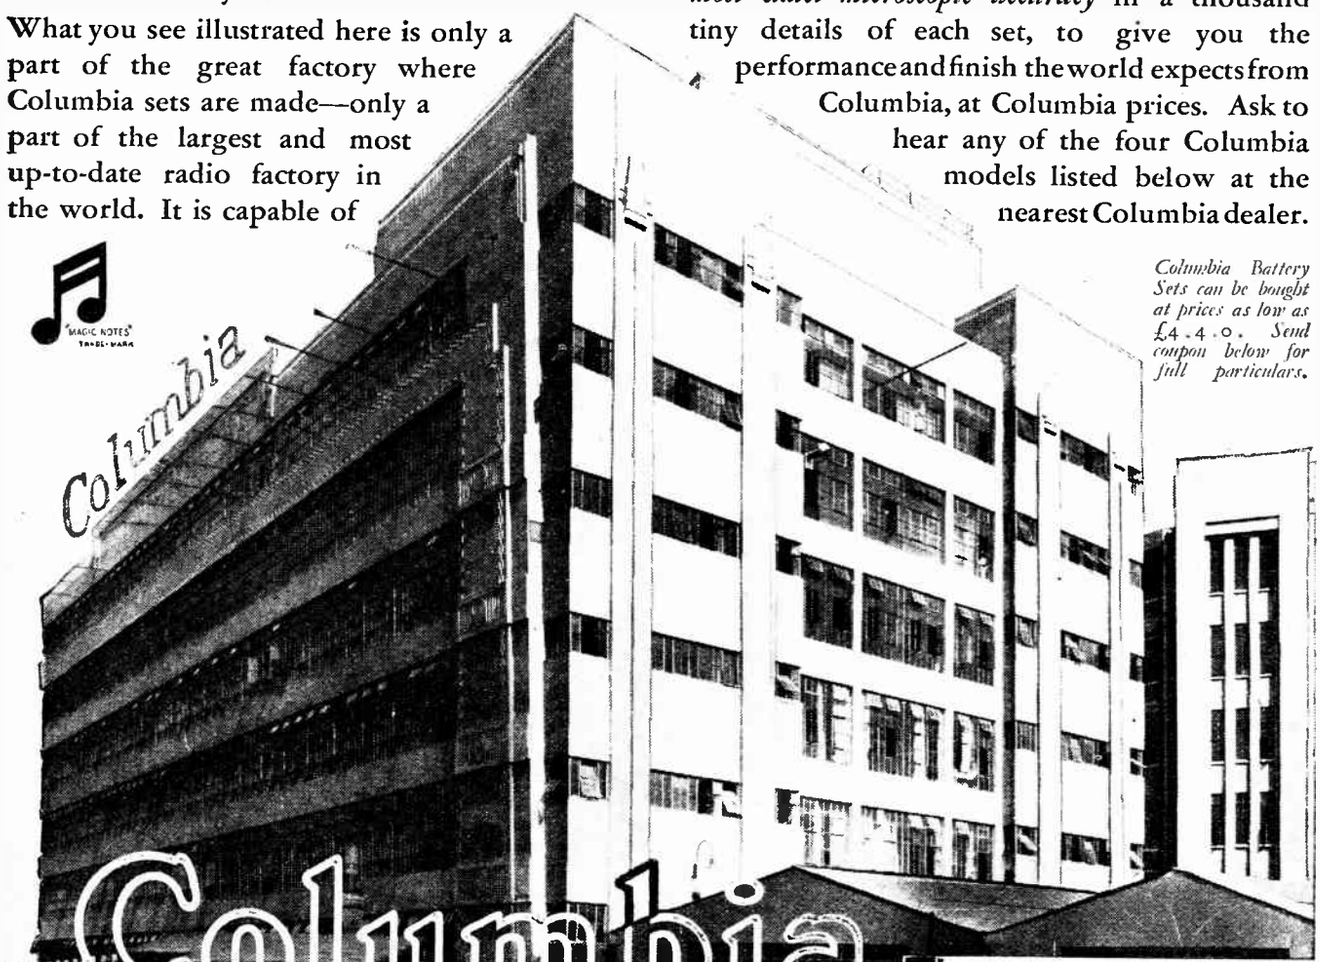
Winder House, Douglas Street, London, S.W.1. *Telephone: Victoria 3405 7.*

Advertisements for "The Wireless World" are only accepted from firms we believe to be thoroughly reliable.

9,000 "HANDS"—MORE THAN EIGHTY ACRES OF FLOOR-SPACE... THE GREAT HIVE OF INDUSTRY WHERE COLUMBIA SETS ARE BORN!

● Huge, towering buildings of concrete, glass, and steel . . . as eloquent in their clean severity of line, as in their materials, keen, relentless modern efficiency . . .

What you see illustrated here is only a part of the great factory where Columbia sets are made—only a part of the largest and most up-to-date radio factory in the world. It is capable of turning out with ease a thousand sets a day—six thousand a week. And yet with this tremendous production there is coupled the *most exact microscopic accuracy* in a thousand tiny details of each set, to give you the performance and finish the world expects from Columbia, at Columbia prices. Ask to hear any of the four Columbia models listed below at the nearest Columbia dealer.



Columbia Battery Sets can be bought at prices as low as £4.4.0. Send coupon below for full particulars.

Columbia

RADIO AND RADIO-GRAPHOPHONES

THE C.Q.A. BATTERY RADIOGRAPH FOUR, Model 1003—*the battery Radiogram with an all-mains performance*: three-stage band-pass receiver. Columbia Constant Quality Amplification. 65 amp. hour L.T. battery. 175 v. H.T. battery including 9 v. G.B. Automatic flood-lighting of scales from switch M.W.-L.W.-Gram. Permanent magnet moving coil speaker. Marconi valves. Walnut cabinet of fine workmanship. **20 Gns.**
(Prices not valid in I.F.S.)

THE C.Q.A. BATTERY FOUR, Model 1001—an entirely new standard of performance and economy from a battery set. Columbia Constant Quality Amplification. Triple action volume control. 60 amp. hour accumulator. 175 v. coded H.T. battery, including 9 v. G.B. battery. Marconi valves. Alternative Aerial tappings and pick-up connection. **11 Gns.**

3-VALVE BATTERY SET, Model 1005. A highly selective set with band-pass tuning, at an unusually low price. Inductively coupled band-pass aerial circuit. Screen grid, high-frequency amplifier. Permanent-magnet moving coil speaker. Single tuning knob for three gang condenser. Marconi valves. **£8.15.0**

ALL-ELECTRIC RADIO-GRAPH FOUR, Model 620—a low-priced all-mains radiogram, embodying every modern development. Band-pass aerial circuit. Screen-grid high frequency amplifier. Energised moving-coil speaker Wave range, 200–550 med. and 1000-2,000 metres. Single knob tuning for three gang condenser. Volume control operating on radio and gramophone. Marconi valves. Fine walnut cabinet. **23 Gns.**

COUPON:

To The Columbia Graphophone Co. Ltd., 98 Clerkenwell Road, London, E.C.1.

Please send me particulars of the new Columbia models without obligation.

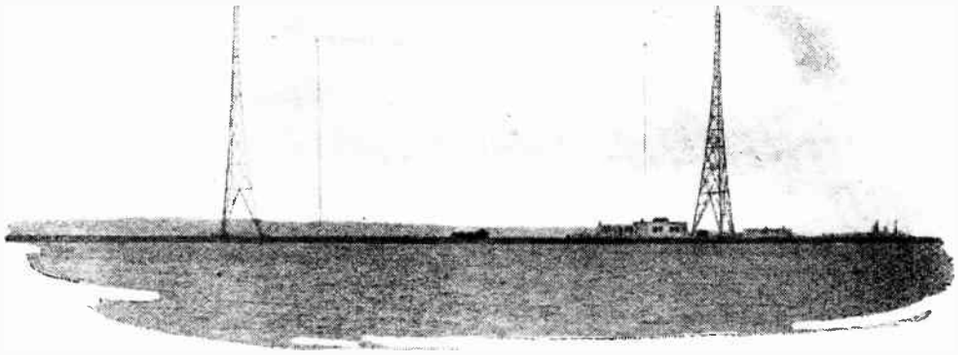
Why Kalundborg is Loud

Novel Features in New 60 kW. Transmitter



Denmark's famous station at Kalundborg occupies a dominating site on a narrow peninsula.

APART from the remarkable strength at which it is received in this country, the new 60 kW. broadcasting station at Kalundborg is notable in several ways, not least in the method of high power assembly. It has been usual in the past to build transmitters in factory-made units. With increase in power and consequently in size of components, this unit system may tend towards a certain mechanical clumsiness, seriously modifying the layout as compared with what would be desirable from an electrical point of view. This consideration led the manufacturers, Standard Telephones and Cables, of Hendon, London, working in collaboration with the Danish Posts and Telegraphs Administration, to adopt a "cellular" system of construction, the high-power amplifying valves and interstage circuits being mounted in a line of cubicles forming part of the building.

Each cubicle, which is inset into the walls, consists of two screened cells in which are mounted the two halves of a balanced push-pull amplifier or output circuit. As a consequence, the transmitter room presents a remarkably simple appearance, in which all that can be seen of the apparatus is the front panels with their indicating dials and switches.

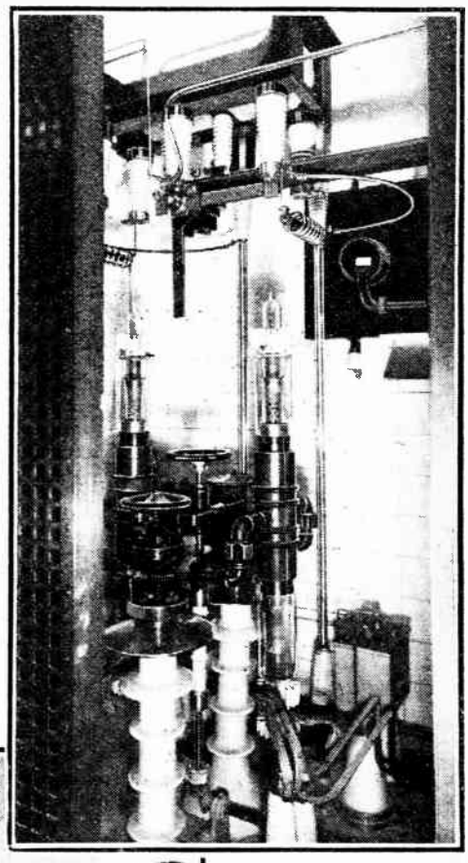
From the circuit standpoint, probably the most prominent feature is the use made of push-pull in the high-frequency stages. Only the Master Oscillator and First Separator are single valve circuits; the Second Separator, the Modulated Amplifier and the three Power Amplifiers are all of the push-pull type. Besides giving an exceptional degree of stability, the use of such balanced circuits aids in the reduction of harmonic content at the output stage, thus reducing the possibilities of interference.

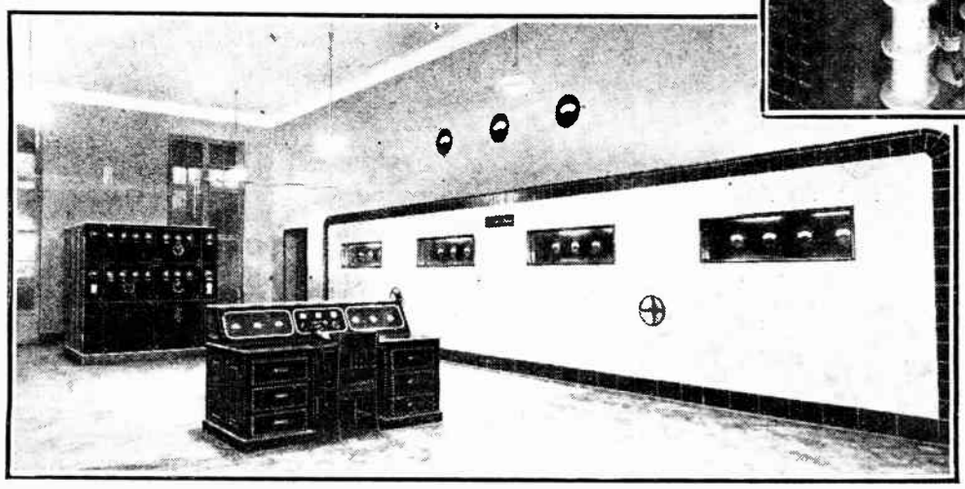
A plate supply of no less than 20,000 volts operates the two high-power stages. This handling of high power at high voltage levels means greater economy and efficiency; the valves used in the last stage are each capable of an output of 200 kilowatts with a plate supply of 25,000 volts.

The Valves

These valves, being of the double-ended type, are designed with the idea of reducing internal capacity. The filament is a system of Tungsten wires kept in tension by means of a spring, and the terminals are fitted with cooling pins so that, despite the large current to be handled—225 amps. at 25 volts—there is no necessity for air blast cooling of the filament seals. The grid terminal at the top end is also fitted with cooling pins. The water jacket, which is a fixture on the anode, is made with flexing ribs, whereby the mechanical stress of contraction and expansion, corresponding to changes in load and temperature of the water, can be taken up safely.

The anode supply for the high-power stages comes from a 20,000-volt rectifier embodying hot cathode mercury vapour valves. It was during laboratory tests with these particular valves that the interesting discovery was made of a former cause of the unreliability which has been a drawback with this type. As a consequence, it is now possible to make satisfactory rectifiers embodying this form of valve, with its extraordinarily high efficiency of the order of 99 per cent. The Kalundborg rectifier is of the three-phase, full-wave type, and is made in two units, each using six valves and giving an output of 10,000 volts, the total output of the two units in series being 20,000 volts, 12 amps. It is believed to be the largest rectifier of its type at present in regular commercial service.





(Above) Two output valves of the double-ended type, each capable of an output of 200 kilowatts at a plate voltage of 20,000. Note the cooling fins and central water jackets.

(Left) This view of the transmitting room, with its control desk, shows the unique "cellular" layout adopted by the manufacturers, Standard Telephones and Cables.

Why Kalundborg is Loud—

The Kalundborg aerial system is of the "multiple-tuned" type, and good radiation efficiency is obtained while using masts lower than the long wavelength would otherwise necessitate. Slung between the two 330ft. masts, the horizontal length of the aerial is nearly 400ft. At each end is a tuned down-lead, one of which is coupled to the transmitter through a short transmission line.

As the station receives most of its programmes from Copenhagen, an elaborate line amplifier system equipment has been necessary with all power supply taken from the station lighting mains. Mercury vapour valves are used for the H.T. supplies and copper oxide rectifiers in conjunction with ballast lamps for the filaments.

While it cannot be claimed that Kalundborg is Europe's most powerful station, it certainly earns distinction on the score of novelty, and it will be interesting to observe whether the new ideas incorporated in the design, particularly in regard to the "cellular" form of construction, become popular in the case of other and more powerful transmitters.

DISTANT RECEPTION NOTES

France's Broadcasting Problems

INTERFERENCE by heterodynes or actual jamming has been rather serious on both the medium and the long wavebands of late. Much of it is due to wavelength wandering, though some of it is caused by illicit stations or by authorised stations working on unauthorised wavelengths. This state of affairs does not augur very well for the success of the Lucerne Plan, for one might have expected that station engineers would now be doing their best to ensure correct wavelength keeping to prepare for it. Some of them will require a good deal of practice in this matter if they are to comply with the stringent rules of the Plan! Governments, too, should be setting their houses in order. It is not to be expected that a miracle will happen on January 15th, and if any country permits illicit stations within its borders to continue broadcasting at the present time there is undoubtedly trouble in the offing.

The French Government is making every effort to obtain the necessary powers to deal with the extraordinary wireless situation that exists within its borders. Bill after Bill to give the Government the power that it needs has been brought before the Chamber, but none of them so far has ever passed into an Act.

The Ferrié Plan

The Ferrié Plan is going forward, though it has been to some extent revised. In its original form it contemplated the erection of fourteen stations, mostly with output ratings of 60 kilowatts, though two or three were rated at 30 kilowatts only. In its present form the scheme allows for ten main stations, one on the long waves and nine on the medium band. The long-wave station will be Radio-Paris, whose power will soon be raised from 75 to 100 kilowatts. In addition to the Poste-Parisien, it is expected that three other high-power French stations on the medium waveband will be at work before Christmas.

The Russian interference with Huizen's transmissions (Hilversum programmes) has ceased for the moment, and it is to be hoped that no more will be heard of it. A good deal of trouble has been caused on the lower part of the medium waveband by spark signals which frequently mar transmissions on wavelengths from about 250 metres downwards. Some of the transmitters responsible are very broadly tuned, and one of them was "double-humping" badly a few evenings ago. It seems a most curious thing that spark transmissions should be allowed to take place during programme hours within the limits of the waveband dedicated to broadcasting.

The number of well-received stations has increased considerably during the last week or two. The improvement is particularly noticeable at the top of the medium waveband, where stations are usually the first to suffer from summer-time conditions and the last to return to their winter strength. Budapest is now well heard on most evenings. Vienna is improving, and will, no doubt, come in well as soon as the aerial mast is in full use. Munich is now strong, and Riga has been coming in at good loudspeaker strength.

Recommended stations on the long waveband are Motala, Luxembourg, Kalundborg, Radio-Paris, and Huizen. On the medium band the choice is very large, and the following list gives those which have been found completely reliable night after night during the week preceding the writing of these notes. Here they are: Brussels No. 1 and No. 2, Prague, Langenberg, Rome, Toulouse, Leipzig, Strasbourg, Breslau, Hilversum, Heilsberg, and Trieste. Many others were good on most nights, but just fail to obtain places in the list owing to occasional heterodyne interference.

D. EXER.

FOREIGN BROADCAST GUIDE

BUDAPEST

(Hungary).

Geographical position: 47° 30′ N.; 19° 3′ E.
Approximate air line from London: 903 miles.

Wavelength: 550 m. Frequency: 545 kc/s. Power: 18.5 kW.

Standard time: Central European (coincides with B.S.T.).

Standard Daily Transmissions.

06.45 B.S.T., Physical exercises; 08.45 (Sun.), 09.45 (weekdays), news; 10.00, sacred service (Sun.); 12.00, carillon; then continuous broadcast until 18.30, concert; talks; 19.30, relay of opera or concert; 23.30, Cigány orchestra or dance music.

Announcers: Man and woman.

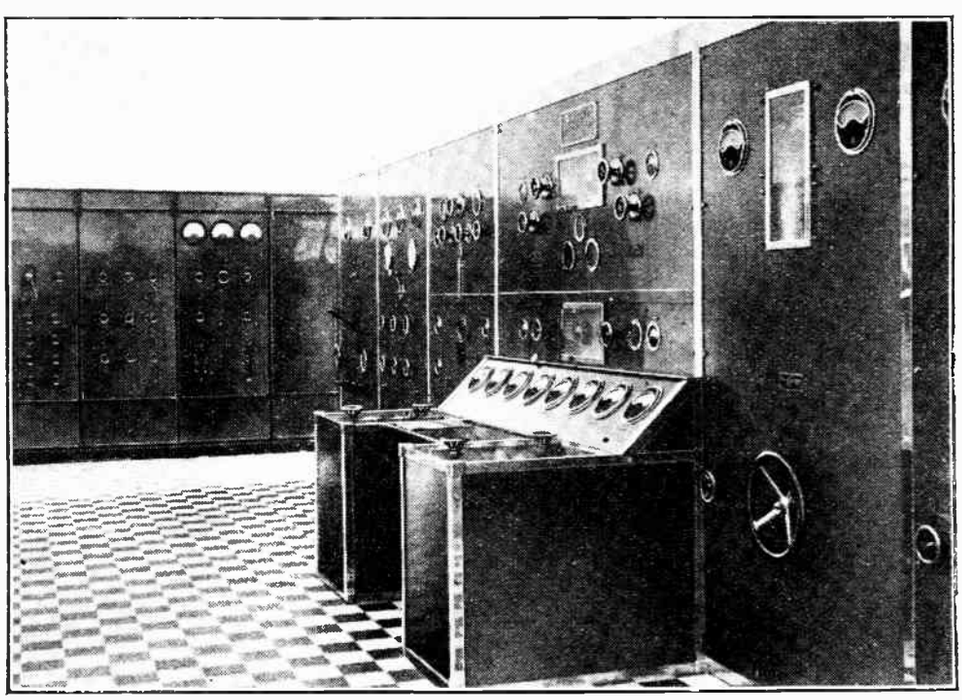
Call: *Hallo! Radio Budapest* (followed by names of relays). Details of programmes are frequently given in the French and German languages; also in English on International evenings.

Interval signal:

When plays are broadcast a gong is used at the beginning and end of each act.

Closes down with good-night greetings in several languages, occasionally followed by the Hungarian Anthem.

Relays: Miskolc, Magyarovar, Pecs—on 209.8 m. (1,429 kc/s), 1.25 kW. Budapest—Csepel, 840 m. (357.1 kc/s), 3 kW., and Nyiregyhaza, 267.4 m. (1,022 kc/s), 6.25 kW.



MARCONI BROADCAST EQUIPMENT IN FINLAND. The control desk and main transmitter of the Finnish Broadcasting station at Viipuri (Viborg), in the background can be seen the switchboard. This station broadcasts on a wavelength of 291 metres and the power is given as 13.2 kW.

News of the Week

Current Events in Brief Review

Test for Ether Searchers

ANY listener with a good receiver has an opportunity to beat the world in an interesting competition which opens on October 1st to discover the set user who can tune in the greatest number of broadcasting stations on the medium waveband between 180 and 500 metres. The stations in question must be situated at a distance of not less than 2,000 miles from the receiving point and on a separate continent.

The contest is being organised by the International DX'ers Alliance, Brighton Grove, Newcastle-upon-Tyne. The competition remains open until April 1st, 1934.

The Sultan's Own

IT is rumoured that the Sultan of Morocco will soon possess a private broadcasting station. On his recent visit to France, the Sultan ordered several receivers, including a short-wave set, and it is understood that special enquiries were made regarding transmission gear.

First Aid by Radio

ALTHOUGH car radio, so far as we are aware, has made no progress in Soviet Russia, motorists are being helped by a new system of short-wave transmitters installed at strategical points on certain main roads. These wireless "posts" are of the fool-proof type, so that any car driver in need of mechanical or medical help can get into immediate radio touch with the nearest regional listening centre to which the transmitter is permanently tuned.

Believe it or Not

THE latest radio story from Paris concerns a small boy whose schoolmaster considered that he deserved corporal punishment. The father, however, refused to take action, and on being questioned by the schoolmaster declared: "I dare not punish the lad; he is the only one in the family able to work the new wireless set."

Polytechnic Wireless Classes

THE London Polytechnic courses in Wireless and High-Frequency Engineering commence on September 25th next, enrolment dates being from September 18th to the 22nd. The courses, which are given in the evenings from 6.30 onwards, are arranged to provide a thorough training in the principles and technique of H.F. engineering, and should appeal specially to those engaged or interested in wireless, gramophone, or talking film work.

The wireless laboratory includes a complete commercial installation for telegraphy and telephony (G6RA).

Fuller particulars can be obtained on application to the Polytechnic, 307-311, Regent Street, London, W.1.

The Tell-Tale Badge

SWISS licence holders are now required to affix an official badge on their receivers to indicate payment of the necessary fee.

Kite as Aerial

A KITE flying at the height of 1,500 feet was used to support a 30-ft. aerial for ultra-short wave experiments carried out by the London chapter of the International Short-Wave Club on September 3rd. The tests were carried out on Parliament Hill, London, with a "Wireless World" Ultra Short Wave Two, and several stations were heard.

Programme Souvenirs

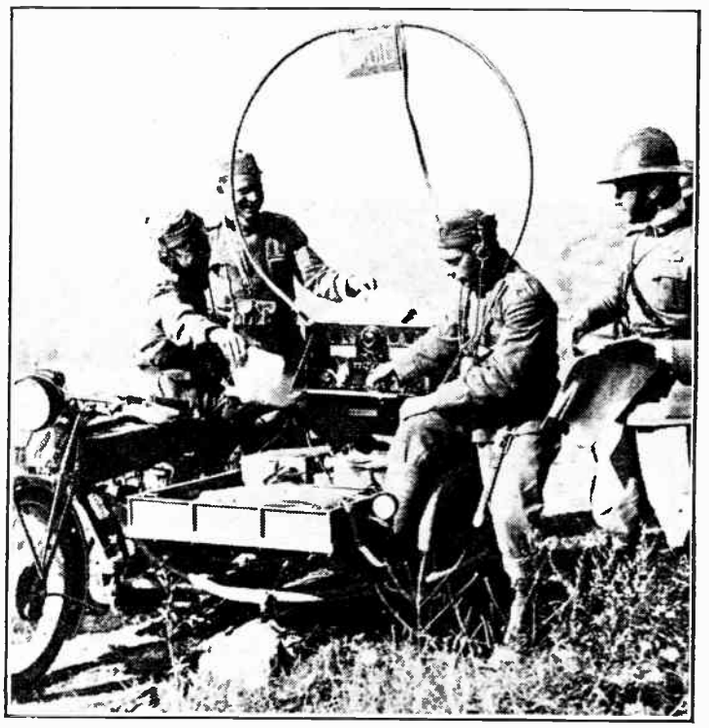
"EIAR," the Italian Broadcasting Company, has now begun the production and sale of gramophone records.

Anti-Static Laws for Germany

GERMANY is considering legislation to stop electrical interference with radio reception. We understand that a Committee is being formed to investigate all causes of man-made static and to report to the Government at the earliest possible moment.

Ban on Interference?

A TYPE of French listener who hopes to escape the new wireless tax is the man who is troubled by man-made static. Many claims have been sent in by individuals who claim exemption because the "parasites" are produced by the Postal Administration itself. The Post Office has bluntly replied in the negative, adding that a decree will be issued within six months on the subject of responsibility for interference with radio reception.



H.Q. CALLING. Battlefield instructions being communicated by a mobile field equipment during recent Italian Army manœuvres.

Boy Scouts Calling

A NEW sub-division of the American "ham" fraternity is the Boy Scouts' network, which now includes about fifty stations, the prime mover of which is H. W. Yalmell, of Helmetta, New Jersey, operator of station W2SN.

Still They Come

THAT kilowatts spell wireless licences is once more revealed in Switzerland, where, since the opening of the high-power transmitters at Söttens and Beromünster, the number of licences has increased by leaps and bounds. Last year the licence figure was 187,080. On June 1st, 1933, the figure had increased to 261,361.

The Gramophone Quota

POSTE PARISIEN has signed an agreement with the gramophone manufacturers limiting gramophone recitals to sixty hours per month, and forbidding a second broadcast of the same record without a special permit. The other French stations are expected to follow suit in the near future.

More Encouragement for German Amateurs

GERMAN short-wave amateurs are about to be granted much more liberty in their experiments. Formerly there were not more than thirty to forty German short-wave transmitters. At least 150 licences are about to be issued.

Super Pigmies in Paris

MINIATURE or "Gulliver" sets are to be a leading feature of the coming Paris Radio Salon; indeed, according to our Paris correspondent, many of the superhets will be "super pigmies." The average weight of the miniature set will not exceed ten pounds.

The main difference between the London and the Paris show will be the almost complete absence at the latter of the battery set. France is "all electric."

Trying Again

BELGIAN architects are to have another opportunity to design a "Broadcasting House" worthy of their country. It will be remembered that the recent competition failed to evoke any effort of the required standard, though the first eight of the competitors have since been awarded consolation prizes of 1,000 francs each. The closing date for the new competition is November 10th.

World Beater Set for Geneva

FACILITIES for hearing the world's broadcasting stations are considered essential for the new Palace of the League of Nations now being built at Geneva. In the Secretary-General's room a wireless receiver is to be installed operating on all wavelengths and capable of picking up any foreign station.

At the Brussels Show

OVER 100 exhibitors, occupying 275 stands, provided Brussels with its fifth annual radio show last week. According to our Brussels correspondent, the event was a triumph for the superhet. Nearly all manufacturers displayed at least one superheterodyne receiver, and all the latest features, such as automatic volume control and silent tuning, were very much in evidence.

Short wave reception has not yet captured the public imagination in Belgium, but this year several short-wave receivers were shown, and it is hoped that this heralds the popularity of this form of reception.

German sets were displayed in large numbers, notably the new People's Receiver. American receivers were also well represented, and considerable interest centred on a 16-valve example which included A.V.C., silent tuning, a Class "B" low-frequency output stage, rectifier and twin speakers, and a tuning range of 14 to 2,500 metres. British sets were well in evidence, but it is a notable fact that the Belgians are most attracted by British components and accessories, which are always assured of a good market.

Slander on the Air

THE Vienna police are still seeking the whereabouts of a mystery station at Oradea, which nightly broadcasts slanderous statements concerning well-known citizens. The transmission begins at exactly nine o'clock each evening, and a regrettable feature of the affair is that nearly all the citizens of Oradea forget the Vienna programmes in their anxiety not to miss the secret transmissions.

Television at the Berlin Show

A Review of the Year's Progress in Germany

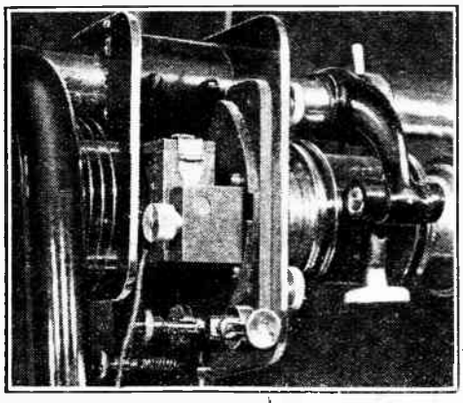
With a regular television transmission on ultra-short waves, Germany is at present taking a lead in television development in Europe. Apparatus for the reception of these transmissions is being developed by a number of manufacturers

DURING the past year, and particularly in recent months, there has been great activity in the field of television in Germany. The German Government is anxious to encourage television. Even so, the only prospect of television at present seems to be on ultra-short waves. German investigators all use twenty-five picture changes and 180 lines, with 40,000 picture elements, and thus obtain pictures far in advance of the current Post Office transmissions.

Some examples of the progress made and shown at the Berlin Exhibition will be briefly mentioned.

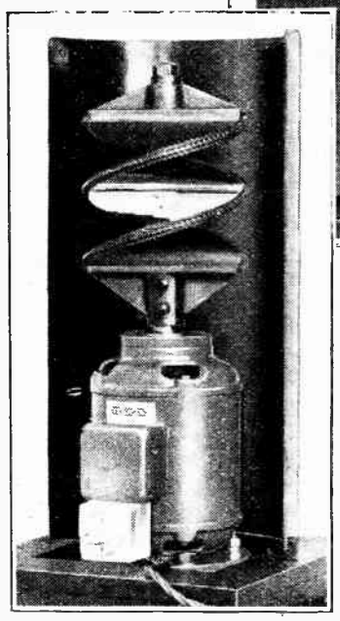
The Principal Exhibits

The Fernseh A.G. has been able to improve to a remarkable extent its well-known "intermediate film" process. In this system the object to be transmitted is first filmed, and the film still wet (in fact, five to ten seconds after exposure) is passed through the televisor and scanned. Formerly it was necessary to use a new film for every record; now, this is no longer necessary. A blank film in an endless band is now used. A sensitised layer is deposited on this by a special apparatus. After passing through a drying chamber the film arrives in the recording camera, where it is exposed, developed, fixed, and led to the



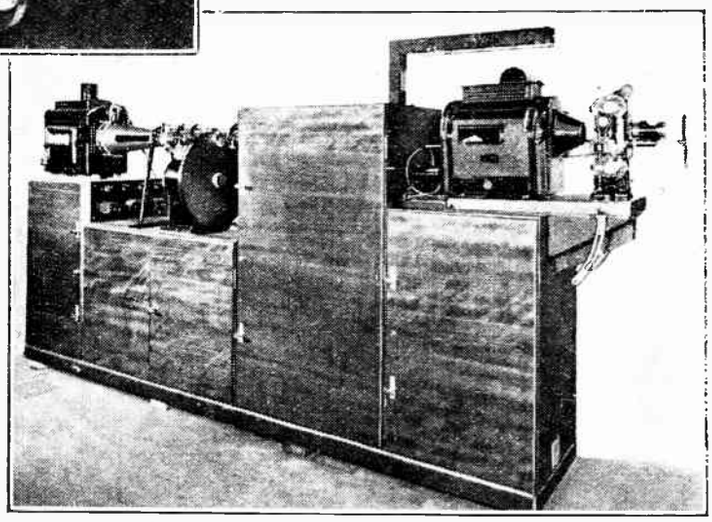
The Fernseh A.G. continuous "intermediate film" television projection receiver, with (inset) a close-up view of the Kerr cell unit which modulates the light.

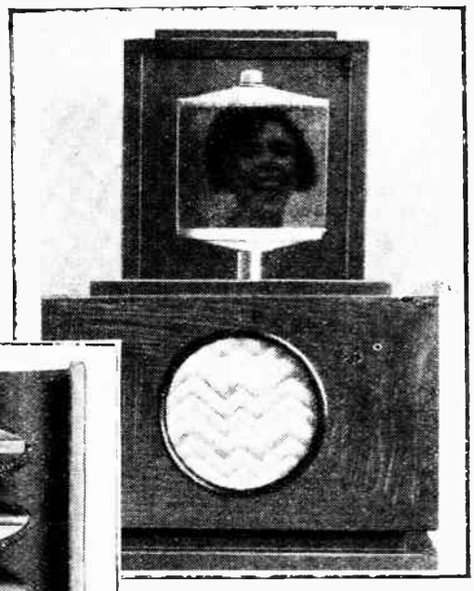
television transmitting apparatus. Once the picture has been scanned, it is wiped out from the film by another process: a new sensitive layer is deposited on it, and the whole circle repeated. Another accomplishment of the Fernseh A.G. this year is the projection of television pictures to a size of 3 × 4 metres, by the following method. An endless band of blank film is provided with a sensitive layer in a special apparatus and is then dried. From the drying chamber the film passes to a window at which the received television picture is recorded as a negative by means of a perforated disc and a source of light modulated as to brightness. Although every separate picture element can only be illuminated for about a millionth of a second, the illumination is sufficient. The recorded picture is immediately developed and fixed and then projected as a positive picture in much the same way as an ordinary film, by a special cine projector. After passing through this projector the photographic layer is removed from the film and replaced by a new one so that the process continues without intermission.



Another exhibit of the Fernseh A.G. is a new light ray scanner for the direct scanning of subjects. The novelty in this process is that the scene and persons to be transmitted are in a closed room whose inner walls are as white as possible and thus possess a high power of diffuse reflection; in this way three dimensional scenes can be transmitted without interfering shadows and with great efficiency.

The Fernseh A.G. were also showing a cathode ray television receiver and a mirror

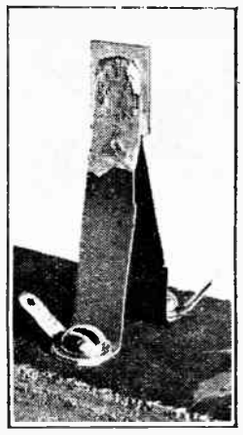




The Te-ka-de mirror screw television receiver and an enlarged view of the mirror screw and motor.

screw receiver, as developed by Te-ka-de.

As in former years, the Te-ka-de exhibited a mirror screw television receiver which is on sale and which this year also reproduces sound. A Te-ka-de novelty is a new type of Kerr cell for the control of the light ray. This Kerr cell does not consist, as usual, of a small condenser in nitro-benzole, but of a crystal through which the light passes. The crystal plate is coated on both sides with metal foil to which the modulating voltage is applied. Under the influence of this voltage the transparency is altered, linearly.



A crystal substitute for the Kerr cell. The crystal transparency varies, depending upon the potential applied across it.

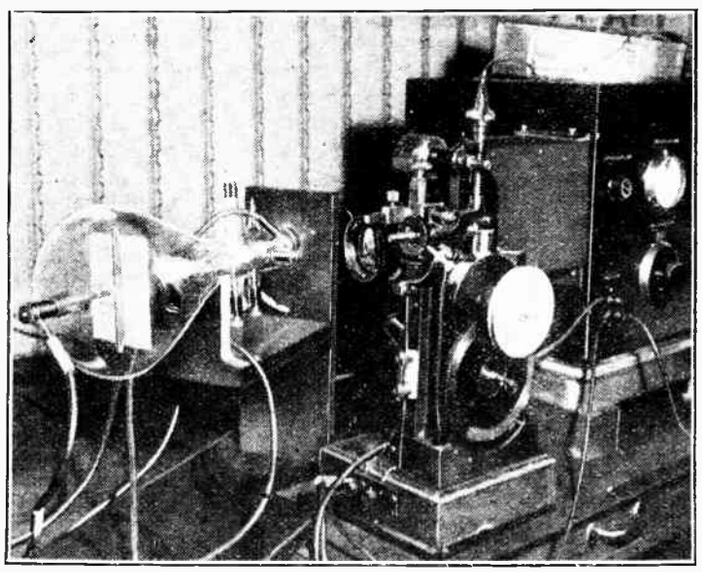
The firm of Loewe exhibited a cathode ray television receiver. The length of this cathode ray tube is 60 cm., the diameter of the fluorescent screen being about 25 cm. The lower portion of the apparatus contains the ultra-short wave receiver, the "Kipp" apparatus for controlling the tube, and a mains unit for providing the necessary voltages. The knobs on the left-hand side of the front regulate the volume for the loud speaker and the tuning of the short-wave receiver, the knobs on the right control the sharpness, and also the switching on and off of the mains

Television at the Berlin Show—

current. The pictures demonstrated were extremely good. In the Loewe aparatus both sound and picture are received on the same receiver, but are then separated by two detector valves.

Telefunken also exhibited a television receiver with cathode ray tube. This, like the Loewe apparatus, has an ultra-short wave superheterodyne receiver.

M. von Ardenne was showing his new cathode ray tube equipment, distinguished by the remarkable brightness of the light spot, so that the images can be observed on the screen in daylight or can be projected. The method used is that of "line control" (speed modulation, in which a constantly bright spot of light travels over the field of view with varying velocity).



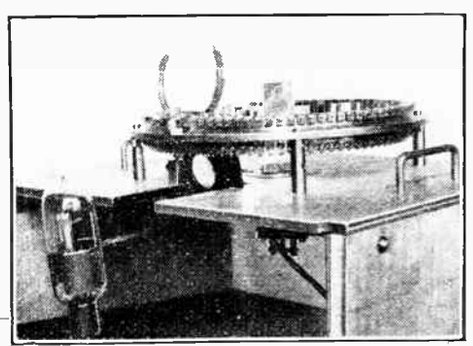
The new cathode ray tube equipment of von Ardenne, employing the principle of speed modulation.

Apart from the Post Office exhibits, which also made use of cathode ray tubes, the new mirror wheel process of Mihaly should be mentioned. This employs a Weiller mirror wheel, in which, however, the mirrors are on the inner side. The mirror wheel W (see diagram) does not itself move, but inside it on its axis there is a small rotating plane mirror M, which is very light. This is driven by a small motor and kept in synchrony with the picture-changing frequency; a ray of light from a very strong source S is thrown on to this mirror, which reflects it on to the mirrors of the wheel. From here the ray is again led back to the little mirror which then projects it through a lens system on to the screen.

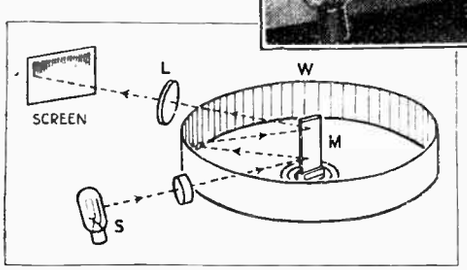
This extremely simple system would appear to have obvious advantages. The tiny rotating mirror only needs a very small and weak motor, which is no bigger than those used in synchronous electric clocks. As a result of this the driving and synchronising energy is extremely small, being only *a fraction of a watt* in the case of the latter. The energy can, therefore, be taken from the receiver itself, and thus the television transmitter controls the synchronism of the receiver.

As already mentioned, the mirror drum is stationary and its different mirrors, when once adjusted in the factory, need no further attention. The images thrown on the screen are sufficiently big to be viewed by a number of people from almost any position of the room. Apart from the technical advantages are the constructional ones, as the manufacturing price of this receiver is low.

At the Berlin Radio Exhibition this receiver was shown working off the 7-metre television transmitter. The image consisted of 90 lines (10,000 elements), there being 90 mirrors on the drum. In this receiver the small rotating mirror was silvered on both sides, so that the rotating speed need only be half of the picture speed, i.e., 750 r.p.m., according to the British standard. The results on the 90-line receiver were pleasing, the detail being about equal to a 9 mm. home cinema outfit. The image size was about 6 by 8 inches. Synchronism was perfect, the picture being rock steady. The internal construction of the receiver can be clearly seen in the illustrations. The complete set contains the actual television portion, together with a 3-valve ultra-short wave receiver for A.C. mains.



The new Mihaly mirror wheel apparatus. The diagram indicates the principle of operation. With the complete receiver, which is enclosed in a cabinet, an external screen on a stand is provided and the picture is projected onto this screen from the receiver.



A receiver for the new German standard of 180 lines will shortly be put into production. This model will probably employ a Kerr cell as a light source, thus giving brighter and black-and-white images.

It is interesting to note that the regular television transmission service of the German Post Office employs ultra-short waves, the picture being horizontally scanned twenty-five times a second in ninety strips, the total number of picture elements or points being 10,000.

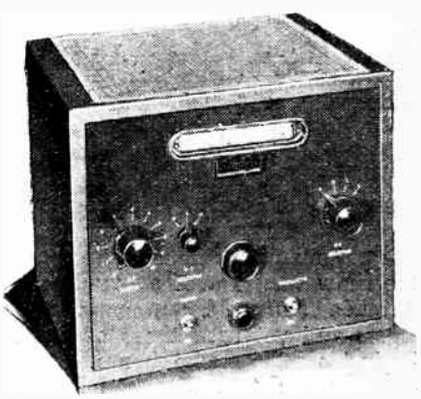
Singleton-Brown Test Oscillator

A Mains-Energised Source of Modulated H.F. for Receiver Servicing

RECENT improvements in the design and performance of receivers have called for a corresponding advance in the skill and equipment of the service man, and a test oscillator is now as essential and important an item on the test bench as the soldering iron or the multi-range meter.

The S.B. Model 2 Modulated Oscillator consists of a screen-grid dynatron R.F. oscillator with three ranges (1,560-545, 375-136, and 148-96 kc/s) modulated to a depth of approximately 70 per cent. by a triode giving three alternative frequencies of approximately 70, 500 and 4,000 cycles. The H.F. ranges and modulation frequencies are controlled by switches on the front panel, and an extra contact on the L.F. switch brings into circuit pick-up sockets which may be used to modulate the oscillator by music or standard frequency records.

The illuminated horizontal tuning scale is divided into 100 divisions and a calibration chart is screwed to the top of the metal cabinet. An attenuator resistance is also incorporated and a calibration curve of the



S.B. modulated oscillator in which the A.C. power pack may be used for external testing.

voltage output is given. The range is from 50 microvolts to 2.5 volts R.M.S., and the output is taken from a plug and jack through a pair of screened leads. A second jack supplies a source of audio-frequency voltage for testing L.F. amplifiers.

The oscillator runs entirely from A.C. mains and the output from the power pack may be used for energising mains receivers in which a fault in the power supply is suspected. Plugs and sockets are provided at the back of the cabinet for this purpose and are rated as follows: L.T. 4 volts 6 amps., H.T.1 200 volts 13 mA., H.T.2 100 volts 7 mA.

The cabinet is constructed of steel and is neatly finished in brown crystalline enamel, the overall dimensions being 12in. x 10in. x 10in.

The price of the Model No. 2 illustrated is £18, and supplies may be obtained from The Singleton-Brown Radio Instrument Co., Singleton House, Compton Road, Wolverhampton. A simplified model omitting the I.F. range and with only one modulating frequency (500 cycles) is also available at £15.

UNBIASED
BY FREE GRID

Glasgolympia

YOU will no doubt be surprised to learn that, although the Scottish Radio Exhibition has been all over for a week now, I am still sojourning in the city of rivets and Red Biddy. I have, in fact, become so imbued with the spirit of Burns and Haig that I can scarcely tear myself away from the place; and at the conclusion of the show instead of returning with the caravan I risked being carted away forcibly.

The language difficulty at Glasgow has proved to be not nearly so bad as I had been led to believe. In any case, forewarned is forearmed; and I had come fully prepared to meet all difficulties in this respect, as my dentist had produced a special denture which was so arranged that it dealt automatically with the Scottish accent, and I flatter myself that my speech was indistinguishable from that of an inhabitant of the Broomielaw. I may mention that my dentist, a Cavendish Square man of considerable repute, specialises in this sort of thing, and has a considerable clientele among the London announcers, many of whom are actually Highlanders who, by the simple expedient of donning trousers and one of his special dental plates, have succeeded in passing the Oxford accent examination at Broadcasting House with flying colours.

One curious case which I encountered at the show was that of a manufacturer who made and sold automatic record changers and yet used those of another make in his radio-gramophones.

Tackling the first salesman I saw, I asked him to lead me gently by the hand and explain. I was, of course, referred to the elusive Mr. Blank, who, as at other radio shows, had gone to his interminable

At Glasgolympia.

lunch. I said I would wait, and did, and after an hour or so the people on the stand evidently realised that they had got to do something about it, with the result that a scientific-looking youth with bulging forehead and horn-rimmed glasses presented himself and proceeded to try on the old dodge inherited from the motoring industry and which is, I believe, known among the fraternity as "blinding the customer with technicalities."

Eventually he retired baffled and gave place to another young man resplendent in gent's autumn suiting whom I took to be the leading salesman. His arguments were long, wordy and unconvincing, and I was getting very impatient when sud-

Blinding him with technicalities.

denly a brilliant idea struck him. "To tell you the truth, Sir," he said, "our own record changers are so much better than those of other makers that we decided to let the public have the benefit of them as our present factory output is not sufficiently large to fulfil the needs of the public and supply our own radio-gramophones as well."

Happily I was glad to see a fine collection of chairs, making it possible to sit down at intervals and reflect upon the frailty of human nature. According to all reports, things were not so comfortable at Olympia.

The dance floor was exceedingly well patronised, and I was glad to see that the authorities had followed the lead of Olympia last year by providing dancing partners. Of these there were so many that I felt quite embarrassed with their attentions.

Arguing with the Blinkers On

AN ophthalmic surgeon, writing quite seriously to the Editor of a well-known daily, states that the cathode ray system of television reception is definitely harmful to the eyesight. Now I am more of an optimist than an optician, but, at the same time, I cannot give any credence to a medical man, however eminent in his own sphere, who supports his assertions by arguments that totter like a superannuated cab horse.

He alleges that the cathode ray system is harmful because, in his view, the picture it gives is as unsteady and as full of flicker as the early movies of thirty years ago, and causes similar eye strain.

I am not going to deny that flickering pictures tire the eyes, no matter whether they emanate from cathode ray radioscopes or early cinema projectors, but what about the pictures given by alternative methods such as the scanning disc receiver?

It seems scarcely credible that an eminent oculist should have sat in judgment upon one type of machine without seeing the results from the other; if he *had* seen the other he would have realised that the older type was not one whit less flickery.

To What Base Uses . . .

A WELL-KNOWN cabinet supplier was discussing with me the other day the relative merits of modernistic bakelite as against wood cabinets, to which latter substance he remains as faithful as the glue which he uses in his products.

I pointed out that one well-known firm was turning its attention to the production of bakelite tables and other major articles of furniture. "In fact," I added, "it is fairly certain that you and I will be buried in bakelite coffins if we live many years longer." "Not for me!" he said. "I am off at once to see my solicitor to guard against such a paradox in my will."

Frankly speaking, I cannot see any reason for retracting my prophecy except that in my own case, of course, not quite

Not all of me will be buried.

all of me will be buried, as I am at present considering several attractive offers from various hospitals and medical schools who want my scalp.

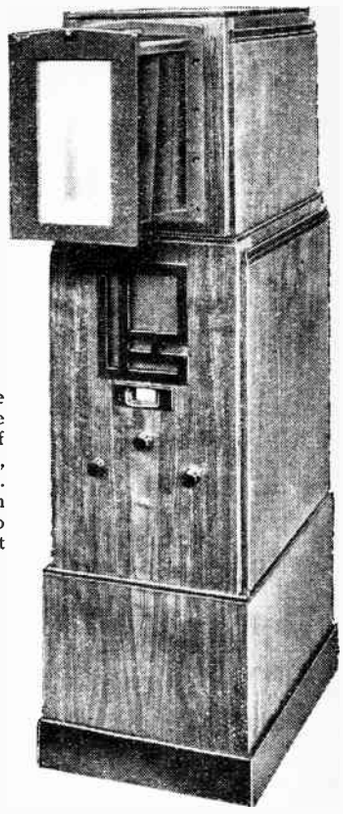
BUSH RADIO BAIRD Television Receiver

An Efficient Mirror-drum Televisor

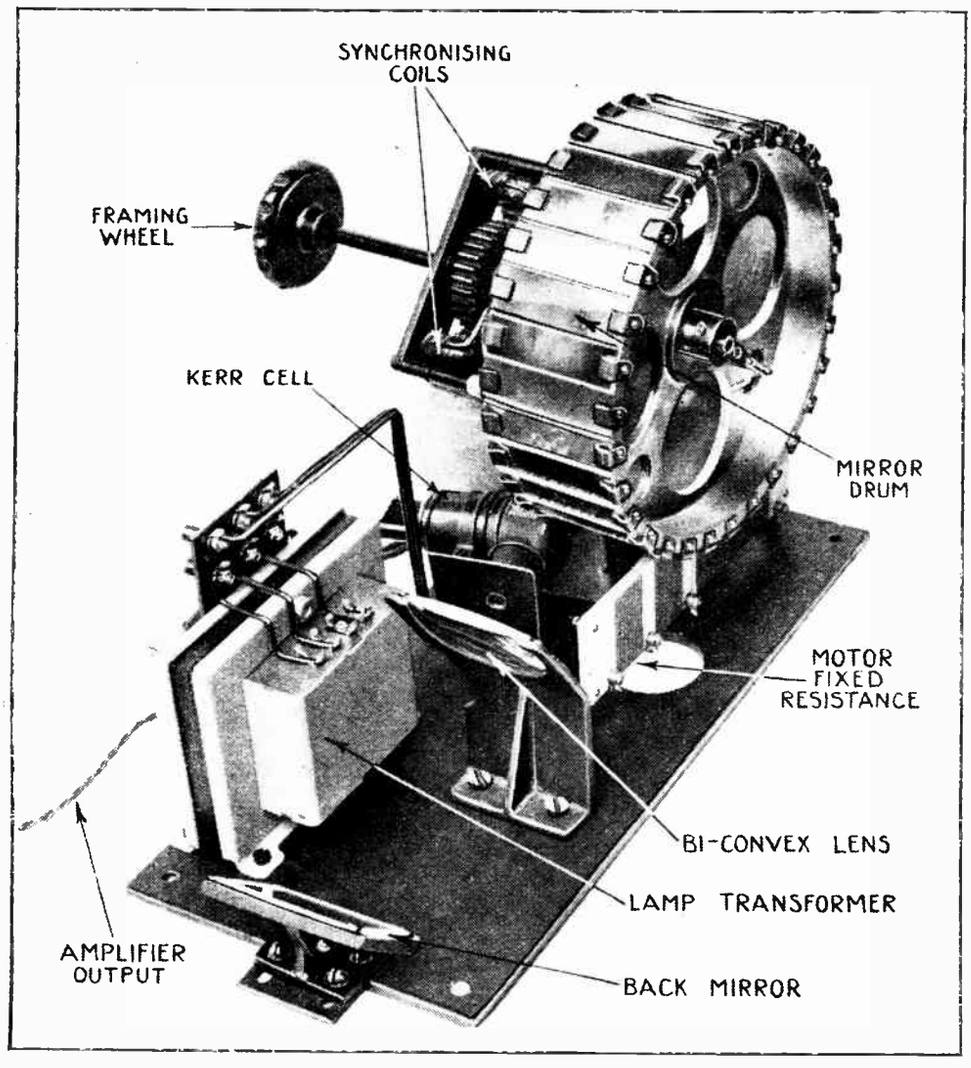
TELEVISION transmission and reception has not yet achieved the degree of perfection which is now found in sound broadcasting, but in spite of this, the possession of a televisor is not without interest. Comparisons between vision and sound are difficult, but it is probable that the results now obtainable from good television apparatus are comparable with those given by sound equipment in the days when the weekly broadcast transmissions from Writtle were an oustanding event.

Unlike sound broadcasting, television receivers must be designed to operate with a given system of transmission, and the transmitter and the receiver are far more closely interlinked. The present B.B.C. broadcasting is carried out on the 30-line, 12½-picture system, which means that 12½ complete pictures are transmitted each second, and that each picture is analysed by scanning it vertically 30 times. With the definition obtainable in this way it is probable that a receiver employing a mirror-drum is as satisfactory as any.

The apparatus under review is contained in a strongly built cabinet, which is similar in shape to that of a miniature grandfather clock; the lower portion contains the receiver proper, the power amplifier, and the mains equipment, while the upper part houses the purely television apparatus. The receiver is of conventional type, including H.F. amplification and resistance-capacity coupled L.F. circuits, and unusual care has been taken to avoid any loss of the upper modulation frequencies. Used for sound reproduction, therefore, the apparatus is capable of giving an exceptionally high standard of quality. Tuning coils are included for the medium waveband only, since there are no television transmissions on the long waveband. A loud speaker is fitted in order to facilitate tuning, and when the station has been found a switch permits a change over to the television equipment.



The picture covers the full area of the screen, 9×4 inches. The screen draws out to the correct position.



The important parts of the Baird projector. The rotary mirror drum works in conjunction with an optical system of adjustable lenses and mirrors.

The output valve is of the 25-watt type and feeds a Baird Grid Cell which acts to convert current, or, more strictly speaking, potential variations, into variations of light intensity. An additional valve of similar type is provided for synchronising, and it is doubtless largely due to the considerable power which it supplies that such a good performance is obtainable.

The Television Equipment

The Baird Grid Cell acts, as a loud speaker in sound reception, to convert the electrical impulses into a form in which they can be detected by the senses. It consists essentially of a type of Kerr cell mounted between Nicol Prisms. A 100-watt lamp is mounted at one end of the assembly, and in its passage through the prisms and cell the light is modulated by the varying electrical potentials on the plates of the Kerr cell. The cell itself is a voltage-operated device, so that at first it seems that a large power valve is unnecessary for its control. Owing to its high self-capacity, however, it must be shunted by a fairly low resistance if frequency and phase distortion are to be kept at a low value. In order to obtain the necessary voltage variations across this resistance quite a large amount of power is required.

The modulated light output of the cell falls upon the mirror drum from which it is reflected on to the viewing screen. The drum contains thirty flat mirrors, each set

Bush Radio Baird Television Receiver—

at a slightly different angle so that with the drum rotating at the correct speed and in the absence of a signal thirty vertical, parallel, and equi-spaced lines appear on the screen. This screen must be at some considerable distance from the mirror, so that to obtain a compact assembly it is arranged with bellows to pull out of the cabinet when reception is required.

The drum is driven by an electric motor, the speed of which is controlled by a variable resistance mounted on the left-hand side of the cabinet with the motor switch and the framing control. To assist in obtaining the correct speed it is fitted with a stroboscopic indicator which is viewed by the light of a neon tube operated by the 50 cycles lighting supply. With the aid of this it is a simple matter to adjust the motor speed. When the motor gathers speed the lines of the stroboscope can be seen slowly rotating, and as the correct speed is approached the apparent rotation is reduced. When the correct speed is found the stroboscope lines appear stationary.

Synchronising is carried out in the usual way. The black edging provided at the transmitter gives a series of pulses, one at the top of each scanning line. Since there are thirty lines per picture and 12½ pictures a second, there are 375 synchronising impulses a second, and in the receiver these are applied to what is virtually a small motor mounted on the main drum driving shaft. If the main driving motor increases or decreases its speed, the synchronising control operates to give a breaking or accelerating effect and to maintain constant speed.

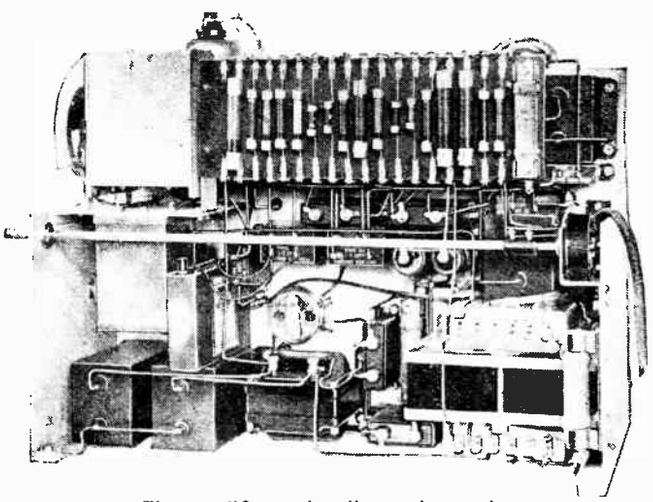
The controls comprise the normal tuning and volume adjustments, and an on-off switch mounted on the front of the cabinet, together with a control which acts to bias the Grid Cell and so regulate the average illumination of the picture. At the side of the cabinet are the purely television controls; the motor speed regulator, the framing handle, and the motor on-off switch, together with a viewing hole for the stroboscope.

Adjusting the Apparatus

In operation, the station is tuned in using the loud speaker as an indicator. The motor is started up and adjusted to its correct speed by the rheostat while watching the stroboscope. A change over from the speaker to the vision equipment is then made, and if perfect synchronism has been obtained the picture will be visible. A "flashing rain" effect indicates that the motor speed is incorrect, and an appropriate adjustment to the controlling resistance effects the necessary alteration.

When the picture appears, however, it may not be in frame; that is, it may be divided horizontally or vertically. This indicates incorrect phasing, and is adjusted by the framing control. This control operates to rotate the carcase of the motor and so moves the picture in a vertical direction. A small movement of this control, therefore, is sufficient to correct for any degree of vertical mis-framing. With most apparatus, horizontal mis-framing is more difficult to correct, and it is usually necessary to slow-up the motor momentarily so that a few pictures are slipped. The operation, therefore, requires some little skill for its successful accomplishment.

In this particular apparatus, however,



The amplifier and radio receiver unit.

the difficulty is avoided by a clever arrangement of the vertical framing control. The picture is arranged to be very slightly out of the vertical, so that rotating the carcase of the motor to produce a vertical displacement of the picture causes also a very slight sideways motion. To correct for horizontal displacement, therefore, it is necessary only to turn the framing control to a much greater degree than is necessary to compensate for vertical mis-framing. As the control is turned, the visual effect is of a number of pictures slowly moving vertically and gradually gliding sideways.

Performance

The operation, therefore, is quite simple, and the performance obtainable probably represents the best that can be achieved with the present 30-line transmissions. The detail obtainable is not high, and dark objects of different degrees of illumination tend to merge together. Thus, a man's chin is quite distinct as long as his head is held upright, but it merges into his tie when he looks downwards and his chin falls into the shadow. The scanning lines are quite obvious, and give a vertical striped appearance to any white object, such as a shirt front.

In spite of these drawbacks, which are unavoidable with the present transmissions, the programme can be followed with ease provided that it does not contain too rapidly moving objects. The degree of definition is such that it is easily possible to recognise a well-known face.

The synchronising is really good, and during the half an hour's transmissions the apparatus often carries through without going out of synchronism even once. Occasional readjustment of the framing is necessary, since there is an occasional slow drift of the picture. The lapses from synchronism are apparently due more to the transmitter than to the receiver, for they invariably occur at the end of an item, when the curtain falls in the studio. Apparently this interrupts the synchronising impulses.

The apparatus is solidly built, and should give long and satisfactory service, and its adjustment does not call for any special degree of skill. The makers are Bush Radio, Ltd., of Woodger Road, Shepherd's Bush, London, W.12, and the apparatus is priced at 50 guineas complete

The Radio Industry

WE are informed by Messrs. J. J. Eastick and Sons, of Eclex House, 118, Bunhill Row, London, E.C.1, that they are able to supply a dual-range "Hartley" coil for the pentode oscillator described in the issue of August 25th. Complete with a suitable D.P.D.T. switch, the coil assembly costs 9s. 6d., or 7s. 6d. without switch.

An attractively written brochure, entitled "A City of Sound," by E. P. Leigh-Bennett, has just been issued by the Marconiphone Company. It describes Marconi activities from the earliest experiments of Marchese Marconi to the present-day work of the factory at Hayes. Free copies will be sent to interested readers.

In our "Show Guide" number it was stated that Fuller "Sparta" batteries are intended for Q.P.P. and Class "B" receivers. The Fuller Accumulator Co. now point out that, although the "Sparta" Batteries may be used for this form of set, their "Triple Capacity" types are especially recommended for the purpose.

The Hawley Products Company of America have now established a European factory and office at 101, Walmer Road, North Kensington, London, W.10. The new firm, under the name of Hawley Products, Ltd., will manufacture loud speaker diaphragms under the original patents; diaphragms can be made in all sizes, and with different response characteristics to meet various specifications and requirements.

1933/1934 Catalogues Received.

Colvern, Ltd., Mawneys Road, Romford, Essex.—Radio List No. 12 dealing with principles, design and application of Ferrocart components. A particularly informative booklet which is obtainable free on application to Colvern, Ltd.

Varley (Oliver Pell Control, Ltd.), Kingsway House, 103, Kingsway, London, W.C.2.—A 28-page booklet illustrating and describing the new season's components, also leaflet dealing with the latest receivers and radio-gramophones.

Igranic Electric Co., Ltd., 149, Queen Victoria Street, London, E.C.4.—New season's catalogue of Igranic devices, containing 48 pages of descriptive matter, technical data and illustrations.

Ward & Goldstone, Ltd.; Frederick Road (Pendleton), Salford, 6, Lancs.—1933-1934 Radio Catalogue R/130, containing 55 pages of descriptive matter and illustrations dealing with "Goltone" components and accessories. Full technical details are given wherever warranted for all components.

Broadcast Brevities

By Our Special Correspondent

Television and the Film Industry

LEST any novelist should be preparing a saga on the decline and fall of the film industry consequent upon the advent of television, it is worth while remarking that the film folk are losing no time in "tying up" with television in this country.

The Coming Tests

It is common knowledge, I suppose, that the new 120-line transmission tests from Broadcasting House, on the Baird and H.M.V. systems, will employ film almost exclusively.

The question arises as to whether the B.B.C. will ultimately rely entirely on celluloid entertainment in preference to the flesh-and-blood variety in the studio.

Complications

Complications are likely to occur. For instance, it is improbable that the film companies will be willing to permit their best efforts to be broadcast—a practice which will eventually mean that a costly film will dissipate half its value in the course of one evening. Again, the film companies are not likely to follow the present practice of the gramophone firms in permitting their products to be put over the ether in expectation that bigger sales will ensue.

No listener or "looker" will feel impelled to dash out and purchase a seat for the film he has just witnessed on his televisor.

By way of self-preservation, the film industry in this country will make a big effort while there is still time to link up with broadcasting.

Sir John Reith's Journey

Very shortly Sir John Reith will be crossing the Atlantic to attend the inaugural ceremony of Radio City, New York, which represents the world's greatest conglomeration of entertainment industries, banded together for mutual support and protection.

It will be interesting to note whether the Director-General, on his return, envisages a similar Palace of the Entertainment Arts in London, with Broadcasting House as the nucleus!

Mr. Melville Dinwiddie, D.S.O., O.B.E., M.C., who has been appointed the Scottish Regional Director.

Another Conflict of Interests?

This, perhaps, is sheer speculation. But those who sense the growing importance of television cannot but see that the present independence of broadcasting and the film cannot endure when television develops.

For example, television may be restricted in the early stages to brief comedies and short items of news interest; ultimately, however, the film industry may find itself in conflict with the B.B.C.

"Effects" in Gramophone Programmes

I HAVE a fancy that "Free Grid" will relish the authentic news that the B.B.C. is adding "effects" to the broadcast of full-length operas on gramophone records. When "Pagliacci" was broadcast with the full gramophone version a short time ago, the Effects Department assisted with a special Columbia record of sounds in a theatre, the tuning-up of the orchestra, and the applause of the audience.

And Why Not ?

Surely this practice could be developed, particularly in relation to talks, which are so badly in need of a little tonic treatment?

Let the B.B.C. engineers take some Blattnerphone records of noises in Hyde Park so that the well-blended murmur of approval and disapproval can form a misty background to the pontifical utterances of some of our more solemn speakers. After all, the speaker himself need not be aware of this background to his remarks. Better not, perhaps, for the hoots and cat-calls which would go down very well with the army of listeners might play havoc with the composure of the professor in the studio.

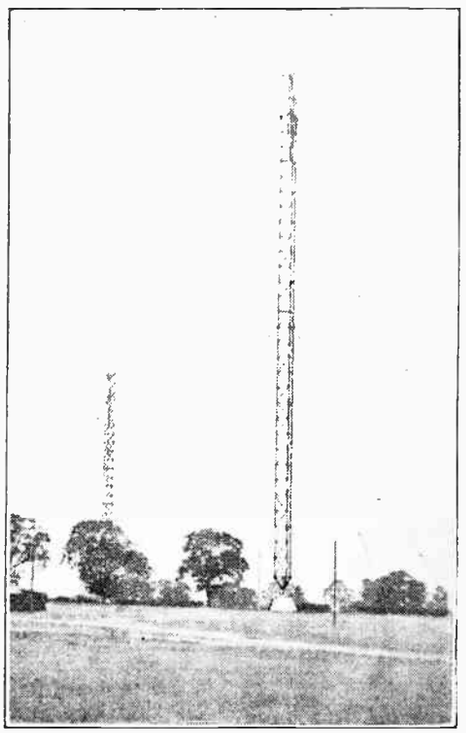
At any rate, the B.B.C. should be prepared to try anything *once*.

The Saturday "News Reel"

THE only striking innovation in the autumn talks programme is the introduction of the Saturday "news reel" after the second general news bulletin. This news reel will be based on the successful experiment of Saturday, July 1st, when news, topical talks, and relays from abroad were grouped in one continuous programme.

Blattnerphone Flashes

Beginning on October 14th, the news and talks, starting at 9 o'clock, will be incorporated in a single programme, and the first three or four minutes will be devoted to a summary of the outstanding events of the day. This will be followed by a more elaborate presentation of the details of these events, possibly by the aid of gramophone and Blattnerphone records, brief interviews with people "on the spot," and a more vivid Sports Bulletin than has been given in the past.



A DROITWICH LANDMARK IN THE MAKING. The first 250 feet of the giant masts of the new B.B.C. National transmitter in course of erection. When finished they will be over 700 feet high.

An Aside

In regard to this last, the B.B.C. remarks rather patronisingly that a number of listeners appear to be interested in no other aspect of human activities.

Big Names in the Making ?

In the main the speakers are familiar names: Vernon Bartlett, Desmond MacCarthy, G. K. Chesterton, S. P. B. Mais, and Sir Walford Davies There are, however, some new speakers, and we may legitimately hope that some hitherto mute and inglorious Miltons are about to burst upon our aspiring ears.

Symphony Concerts

THE detailed programmes for the series of symphony concerts, which begin on Wednesday, October 18th, have now been issued by the B.B.C. They will, as usual, be conducted mainly by Dr. Adrian Boult, but several famous guest conductors will also do their share.

Handel Modernised

AMONG the numbers to be performed for the first time in England are Bartok's Concerto No. 2 for pianoforte and orchestra, in which the composer will play the solo instrument; Alban Berg's "Wozzeck" and an arrangement by Arnold Schönberg of Handel's Concerto Grosso for string quartet and strings. It will be interesting to hear how Handel stands modernising, though it is difficult to imagine our old friend George Frederick in the dress of one of the ultra-moderns.

Political Talks

PERHAPS the greatest novelty in the coming season's talks will be the political addresses to be given on Thursdays at 9.20 p.m., in which the speeches will not be subject to preliminary censorship.

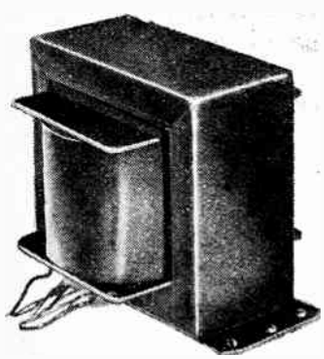
LABORATORY TESTS

NEW RADIO PRODUCTS REVIEWED

PARTRIDGE MONODIAL MAINS TRANSFORMER

PROSPECTIVE constructors of *The Wireless World* New Monodial Super may be interested to learn that a mains transformer for this set is now obtainable from N. Partridge, King's Buildings, Dean Stanley Street, London, S.W.1. The component is designed on very generous lines, for it measures 6⅞in. × 4⅜in. × 4½in. high overall, and, in view of these dimensions, it would seem desirable that slight alterations be made in the size of the baseboard for the power pack. An increase of ¾in. in the length and of ½in. in the width would provide the additional space required. Increase in the latter direction may be avoided, however, by bending one of the fixing lugs at right angles and screwing it to the side of the baseboard, but the extension in the length is far preferable to a rearrangement of the components.

The various leads are brought out through the lower cheek of the bobbin, and thus fall convenient for passing through to the underside of the baseboard and thence to their respective anchorage points. The primary winding is screened, and a separate earth lead brought out. Small tags are tied on the wires for identification. Tappings are provided on the primary for supply mains of 200, 230, and 250 volts 50 cycles A.C.



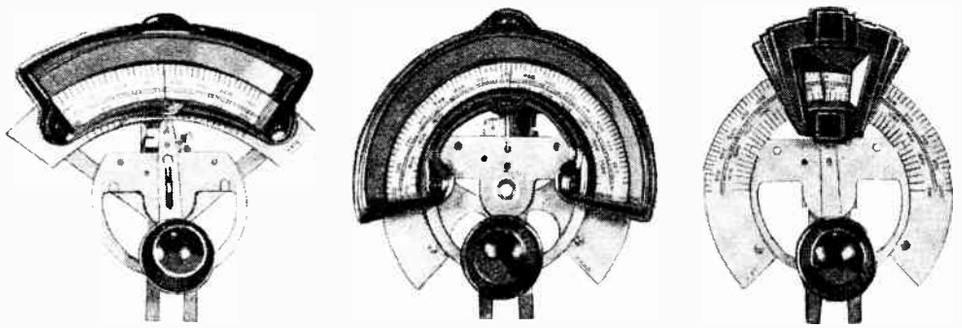
Partridge mains transformer for the New Monodial Super.

With all windings giving the specified output currents, the various voltages when measured were found to be correct for the satisfactory operation of the set. After smoothing, the H.T. supply measured 430 volts with 120 mA. flowing; the two one-amp. L.T. windings showed 4.01 volts, while the rectifier filament and the six-amp. windings were each giving 3.98 volts.

The transformer runs perfectly cool; there is no trace of mechanical hum due to looseness in the core or in the assembly; and, altogether, the component is a sound electrical job, which, at 36s., represents very good value.

NEW POLAR DIALS

THE Polar range of condenser dials now includes six models; three are full-vision type, two are disc drives, and one is a drum pattern. The four latest additions, described respectively as the Horizontal, the Arcuate, the Semi-Circular, and the Moving Scale Disc drives are calibrated in wavelengths for Polar condensers, assuming a minimum capacity of the order of 70 m-mfds., and coils of 157 microhenrys and 1,900 microhenrys for medium- and long-wave pre-selector circuits. For superheterodyne sets the oscillator coils should have inductances of 126.5 and 925 microhenrys respectively. But a plain graduated scale is provided as well, which in the Horizontal and Arcuate models is divided in 100 divisions, and in the remainder into 180 degrees. These drives are very robust, well finished, and quite free from slip or backlash. The reduction ratio is about 8 to 1, and the knob drives the pointer in the same direction as its rotation.



Polar condenser drives; illustrating the Arcuate, Semi-Circular and the Moving Scale Disc Models.

The new models can be supplied fitted with a small air-dielectric trimmer condenser giving a variation of about 50 m-mfds., its control being mounted concentric with the tuning knob. Dual lamp-holders mounted on a removable clip are fitted, and the prices are 5s. 9d. each for the three full-vision types, 4s. 6d. for the new disc model, 5s. for the plain disc pattern, and 7s. 6d. for the drum drive. Escutcheon plates of appropriate design for each model in brown bakelite, also knobs to match, are included, together with fixing screws. The trimmer condenser adds 2s. to the price of each model.

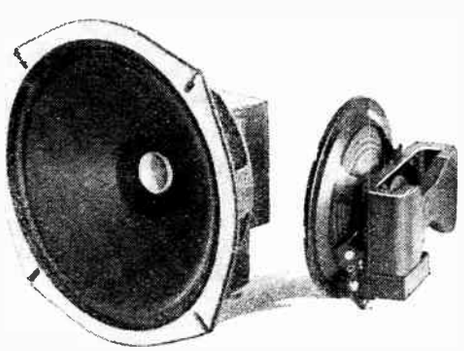
TWO SONOCHORDE REPRODUCERS

IN producing the Sonochorde de Luxe models the makers have set out to provide a chassis unit of better finish and external appearance than the average "set builder's" loud speaker. It is finished in a very attractive two-tone cellulose enamel, and the transformer is enclosed in a detachable metal cover with a rubber bush for the connecting leads.

In the mains-energised model tested the field terminals and those of the input to the transformer were, in our opinion, spaced rather too closely, but there is no reason why trouble should arise in this quarter if it is realised that special care must be taken to avoid short circuits due to stray strands of wire.

As regards sensitivity, few loud speakers we have tested in this class have given better results. The quality is well balanced and the output is exceptionally uniform from 150 to 2,000 cycles. There is a bass resonance at 130 cycles, and the output falls gradually to a cut-off at 75 cycles. Between 2,500 and 4,000 cycles the output is five or six decibels above the average level, and above 5,000 cycles it falls off rapidly. The price of the de Luxe energised model is 35s., and of the permanent magnet model 65s., or 67s. 6d. with Class "B" output transformer.

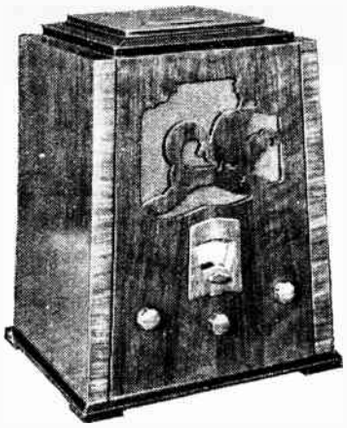
The new Sonochorde Midget has been designed for portable sets and car radio, and has a cone diameter of 4½in. In spite of its small size (the depth is 2⅝in. in the energised and 2¼in. in the P.M. type), the performance is remarkably good, and the quality is to be preferred to many moving-iron units of comparable price. The middle and top register reproduction is very similar to that of the average medium-sized moving-coil loud speaker except that the increased output in the upper middle register is somewhat higher in frequency—approximately 3,800 cycles. There is not much output below 150 cycles, but the "bass" resonance at 260 cycles serves to prevent the reproduction becoming too high pitched. On both speech and music the balance is really rather surprising, having regard to the small size of the diaphragm. Naturally the efficiency is not so high as that of units employing larger magnets and diaphragms, and for a given sound output an increase of about 4 db. in the power input is necessary above that required by the average 7in. diaphragm unit. On the other hand, the power handling capacity is good, and over one watt was applied before chattering made itself heard. The price of



Sonochorde de luxe D.C. and Midget P.M. moving-coil loud speakers.

the permanent magnet model is 21s., and of the D.C. model 17s. 6d. The latter is available with 2,500- or 6,500-ohm field, and both types may be supplied with transformers for power or pentode valves.

The makers are Sonochorde Reproducers, Ltd., 1, Willesden Lane, London, N.W.6.



Varley "SQUARE PEAK" 4 Model A.P.46

High Selectivity with an Unconventional Circuit

FEATURES. ***Type.***—*Four-stage table model superheterodyne for A.C. mains. Internal moving-coil loud speaker. Provision for pick-up and external loud speaker.* ***Circuit.***—*Signal frequency amplifier—oscillating detector with I.F. transformer—second detector—pentode output valve. Full-wave valve rectifier.* ***Controls.***—*(1) Main tuning. (2) Waverange operated by sliding escutcheon. (3) Volume. (4) Reaction in I.F. circuit.* ***Price.***—*15 guineas.* ***Makers.***—*Messrs. Varley, 103, Kingsway, London, W.C.2.*

THE four-valve superheterodyne receiver, on account of its superior selectivity, is gradually ousting the three-valve straight set from its position as the "standard" receiver of the day. The number and variety of sets of the former type shown at Olympia were sufficient indication of the trend of events in this direction.

In the Varley Model A.P.46, however, we have something more than "just another 4-valve superhet," for there are many points both in the circuit and the structural design which indicate original thought rather than mere repetition of current practice.

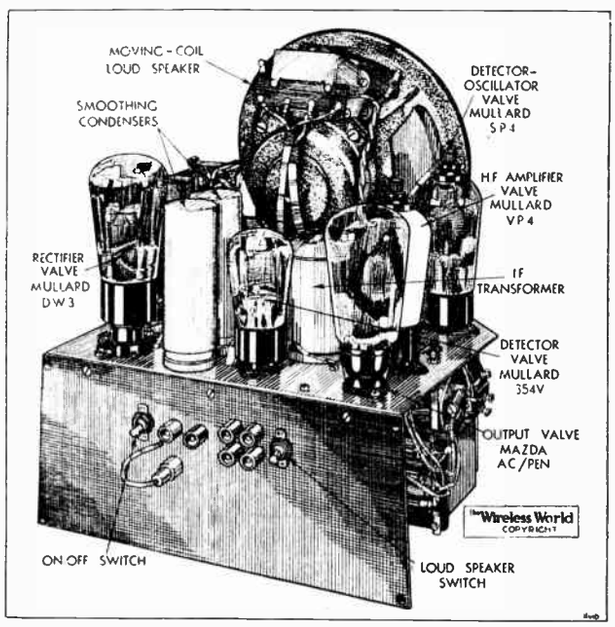
Probably the most interesting innovation is the omission of valve amplification in the I.F. stage. There is, of course, an I.F. transformer in which both windings are tuned, so that the full advantage of the superheterodyne principle from the point of view of selectivity is retained. This is further enhanced by reaction applied to the I.F. transformer from the second detector stage.

The first valve, which is usually the detector-oscillator in a 4-valve superhet, in this case is used purely as an H.F. amplifier. It is of the variable-mu pentode type, and volume is controlled in this stage by simultaneous variation of the bias and screen grid voltages. Incidentally, it is the primary of the H.F. transformer which is tuned, and this circuit is ganged with the tuned aerial circuit and with the oscillator circuit associated with the second valve. This, again, is of the H.F. pentode type and combines the functions of oscillator and first detector. It is coupled to the second detector—a triode—through the band-pass I.F. transformer. Transformer coupling is employed between the detector and the pentode output valve, and tone correction is applied across the primary of the output transformer to the moving-coil loud speaker. The external loud speaker is connected through a condenser across the output transformer primary, and is therefore suitable for high impedance loud speakers as well as moving-coils fitted with a suitable transformer.

The controls consist of main tuning, volume, reaction on the I.F. circuits and waverange. The latter is controlled by switch mechanism attached to the moulded escutcheon plate which slides up or down, thus exposing the appropriate scale and station calibrations. It is interesting to note that the makers are already supplying tuning dials with stations distributed according to the Lucerne agreement, which comes into force in January next.

At the back of the chassis, in addition to the usual sockets for aerial and earth, pick-up, mains aerial and external loud speaker, there are two tumbler switches. One is connected in the mains supply circuit and the other disconnects the loud speaker in the set when it is desired to use the exterior loud speaker only.

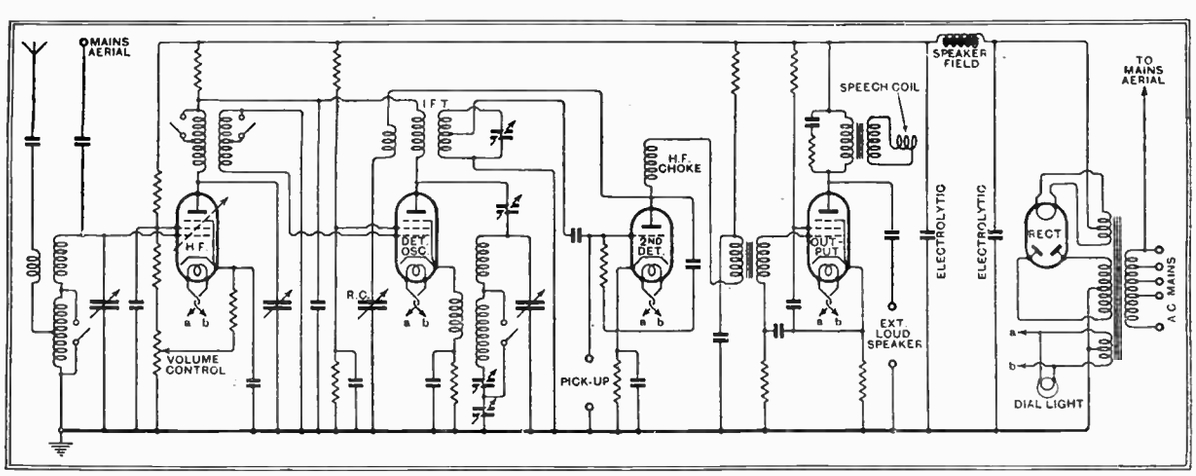
The performance of this set amply justifies the deviation from convention in the circuit arrangement. Whistles due to second channel interference are considerably reduced by the signal frequency stage, and the four tuned circuits in conjunction with the reaction in the I.F. circuits give a high degree of selectivity. Zeesen on long waves is easily tuned in free from Daventry and Radio Paris, while, in Central London, on medium waves, only two channels are lost, on either side of the Brookmans Park National and Regional stations. The performance as regards selectivity seems to be equal to that of the average four-stage superhet, without having to resort to the use of reaction, which may be kept in reserve for exceptional receiving conditions.



The moving-coil loud speaker and chassis form a single unit in the Varley A.P.46 receiver.

Quality of reproduction is bright, with an adequate foundation of bass, and transients are noticeably good. Mains hum is negligible.

To summarise, in the Varley A.P.46 we have a receiver at a reasonable price which is original in design and capable of a performance in range and selectivity which is above the average for a superheterodyne of four stages. The only criticism we have to make is that there is room for improvement in the mechanical rigidity of the chassis; but this is of concern more to the service engineer than the user.



An unconventional feature of the circuit is the omission of valve amplification in the I.F. stage. The selectivity of the I.F. circuits is supplemented by reaction from the second detector.

Next Week's Set Review

H.M.V. SUPERHET CONCERT SEVEN Model 467

READERS' PROBLEMS

THESE columns are reserved for the publication of matter of general interest arising out of problems submitted by our readers. Readers requiring an individual reply to their technical questions by post are referred to "The Wireless World" Information Bureau, of which brief particulars, with the fee charged, are to be found at the foot of this page.

Condensers in H.F. Circuits

EVER since non-inductive by-pass condensers appeared, it has been consistently advocated that they should be employed in all H.F. circuits in preference to those of the older type. To ensure that by-pass and decoupling condensers shall be entirely effective in such circuits, it is strongly recommended that attention should be paid to this point.

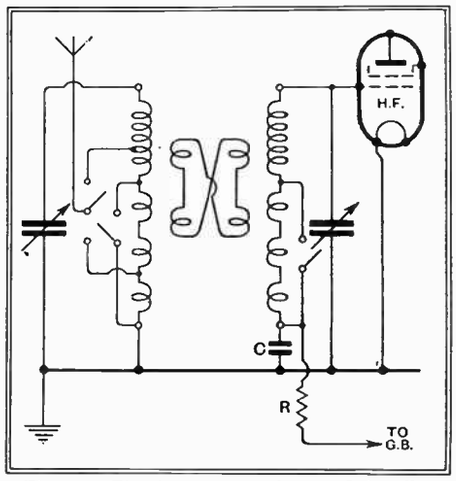


Fig. 1.—The by-pass condenser C is effectively in series with the secondary tuned circuit, and if this condenser has appreciable inductance, the matching of the secondary coil will be affected.

A correspondent, who realises that it would be fatal to employ an inductive condenser in such a position that it would be common to the two component circuits of a band-pass filter, nevertheless seems to think that an old type of condenser might be used satisfactorily for decoupling the H.F. grid circuit of the Modern Battery Four (*Wireless World*, August 11th). This condenser is not common to both filter circuits, and so it is argued that, even if it be slightly inductive, filter coupling will not be affected.

All this is true enough, but our correspondent has overlooked the fact that the condenser in question is in series with the second tuned circuit, and therefore, if it happens to have an appreciable inductance, it will upset the matching of the two coils. Any inductance in the condenser will be additive to that of the secondary winding; this is made clear in Fig. 1.

Gilding the Lily

IT has been asked whether it would be worth while going to the trouble of fitting a band-pass input circuit for the New Monodial superheterodyne; a second reader words his question rather differently by asking whether the quality of the receiver would be improved by such an addition.

Although it cannot be denied that an additional tuned circuit is bound to lead to increased immunity from second-channel interference, the benefits to be derived from such an addition are not considered to be sufficient to warrant the extra complication and cost involved. So far as quality is concerned, no improvement would result from this addition, as the loss of side bands which inevitably takes place in a single-tuned input circuit was taken into account in the design of the tone-correction system.

Car Sets Afloat

IT has occurred to a reader that one of the recently introduced motor car sets would be almost ideal for installation on board his cabin cruiser, where space is at a premium. The engine is fitted with 12-volt electrical system and a large battery. We are asked to say whether any unsuspected difficulties are likely to arise in operating the set, and, indeed, to criticise the proposal in general.

Although we have not yet had any personal experience of the use of car sets for this purpose, we can see no reason why they should not be entirely satisfactory for motor boats or motor yachts, provided that a suitable converter or battery be fitted. It is understood that these specialised receivers are installed on board many motor cruisers in America.

Limitations of Multiple Valves

THE user of a "straight" H.F.-det-L.F. three-valve set asks whether it would be satisfactory to replace the present detector valve by a double-diode-triode, and, with the help of this valve, to obtain automatic volume control without loss of sensitivity and without adding to the number of valves in the receiver.

Although these new valves provide an excellent solution of the problem of adding A.V.C. to a "2-H.F." set, we fear that our present querist may be dissatisfied if he makes the proposed alterations. All "1-H.F." sets depend largely on reaction for their sensitivity, but this invaluable aid to long-distance reception must be forfeited if one of the new valves be fitted.

A.V.C. Without Alteration

ANOTHER query dealing with the addition of A.V.C. to an existing receiver comes from a reader who wishes to fit an "amplified and delayed" automatic control to his "2-H.F." A.C. receiver without making any internal alterations. It is stipulated that the control valve shall be entirely mains-operated.

Were it not for this latter stipulation, we would suggest the A.V.C. unit described in *The Wireless World* of March 31st. The threshold value of signal strength at which the control exercised by this unit comes into operation may be adjusted to any desired extent; further, the system is an "amplified" one, as the control valve acts as a D.C. amplifier of voltage changes appearing on the anode of the detector valve. Although not impossible, it would be difficult to arrange the unit for "all-mains" feed, but our correspondent might like to effect a compromise by supplying the anode of the valve from the mains through a separate rectifier, a battery being used for grid bias purposes.

The Wireless World
INFORMATION BUREAU

THE service is intended primarily for readers meeting with difficulties in the construction, adjustment, operation, or maintenance of wireless receivers described in *The Wireless World*, or those of commercial design which from time to time are reviewed in the pages of *The Wireless World*. Every endeavour will be made to deal with queries on all wireless matters, provided that they are of such a nature that they can be dealt with satisfactorily in a letter.

Communications should be addressed to *The Wireless World* Information Bureau, Dorset House, Stamford Street, London, S.E.1, and must be accompanied by a remittance of 5s. to cover the cost of the service. The enquirer's name and address should be written in block letters at the top of all communications.

True Selectivity

PROBABLY the most common question propounded to the Information Department deals with the improvement of selectivity of existing receivers. In replying to such questions, it is comparatively easy to suggest methods whereby the signal input from the aerial, or the H.F. magnification of the set, may be reduced, and thus an apparent improvement in selectivity be obtained. But this improvement will always be at the expense of sensitivity; none of the popular "losser" methods can do anything towards improving the true selectivity of a receiver.

This can only be done by improving the "goodness" of the tuned circuits in the set or by adding to their number. The first alternative is generally impracticable, but the second can generally be put into effect by adding an external tuned aerial circuit to receivers which do not already include a band-pass input.

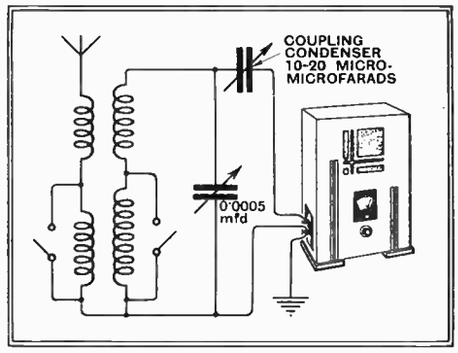

Fig. 2.—The most practical method of adding an extra tuned circuit, and thereby improving true selectivity.

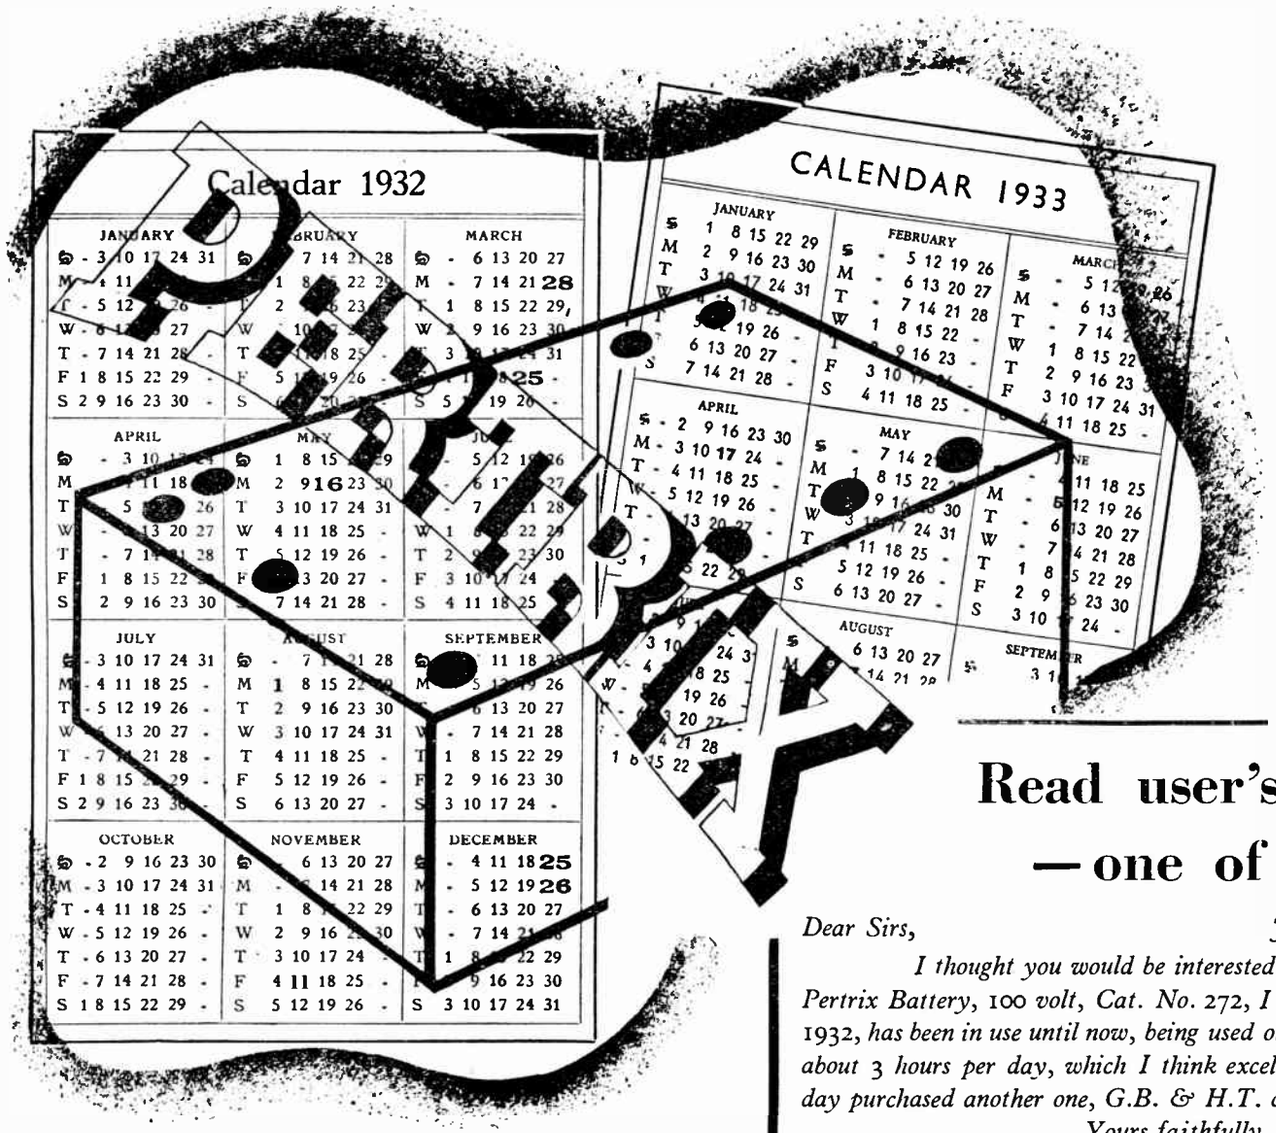
Accordingly, this is the plan that is usually recommended, and for the benefit of several readers who have written on the subject, the circuit diagram of a satisfactory arrangement is reproduced in Fig. 2. The necessary apparatus is, of course, mounted externally to the receiver, and may be accommodated in a small box. Any reasonably effective standard coil assembly may be used, and particular care should be taken to see that the coupling condenser has a really small minimum capacity. It is worth while mentioning that the new iron-cored tuning coils are suitable for this purpose, and also that the addition of a separate aerial tuner may necessitate the need for "reganging" the original input circuit of the receiver.

His PERTRIX Battery lasted *EIGHTEEN MONTHS!*



Read user's letter —one of scores

Dear Sirs, *July 29th, 1933*

I thought you would be interested to know that a Pertrix Battery, 100 volt, Cat. No. 272, I purchased Feb. 1932, has been in use until now, being used on an average of about 3 hours per day, which I think excellent. I have to-day purchased another one, G.B. & H.T. combined.

Yours faithfully,

F. M. U., Bellingham

The above letter can be inspected at the offices of Britannia Batteries Ltd., 233 Shaftesbury Avenue, London, W.C.2.

Eighteen months use—an amazing record of active service and therefore of money saved. Yet this is no unusual feat for a Pertrix—almost every post brings a letter from some member of the public whose Pertrix has lasted a year or more! Only a Pertrix High Tension Battery could give such service, because Pertrix is the only battery that uses a patent *neutral* electrolyte. There is no constant corrosive process going on inside any Pertrix. Its power is not turned against itself. There is no "shorting" between the zinc cells. A Pertrix will give the same number of hours' service, whether you use your set every day or intermittently. These amazing batteries recover power overnight—preparing for the next day's programme. H.T., L.T., or G.B.—*there is a Pertrix that fits your set.*

FIT PERTRIX *FOR GOOD*

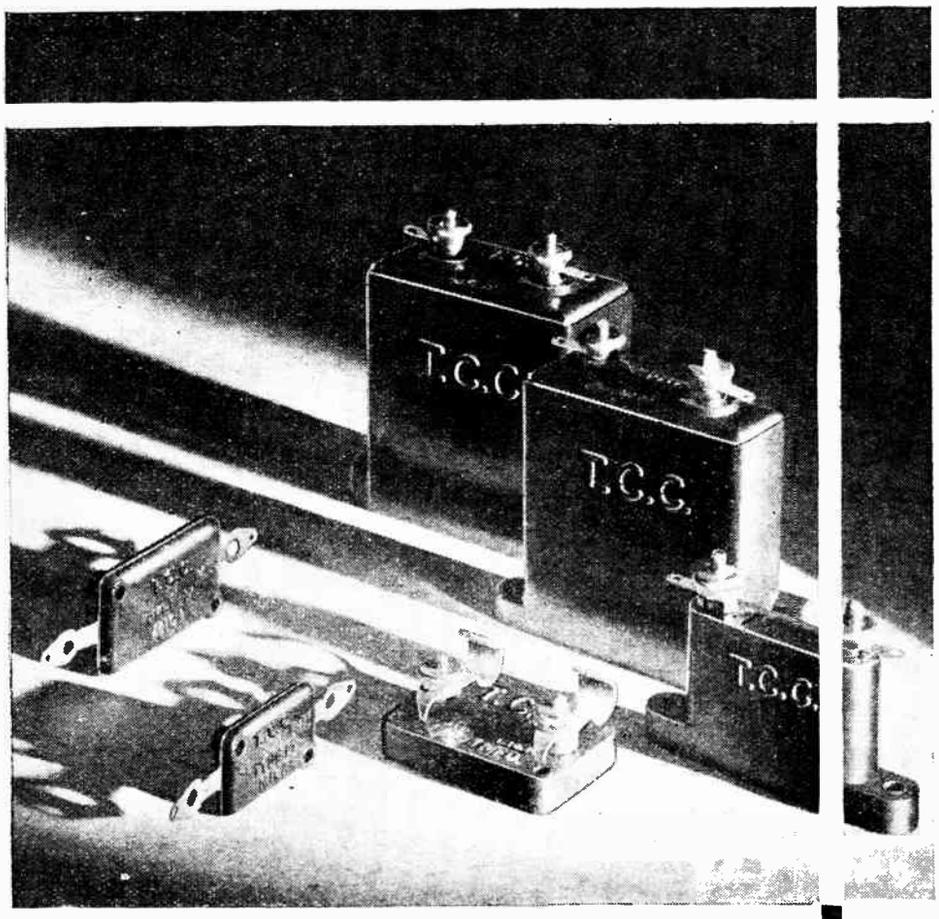
Advertisements for "The Wireless World" are only accepted from firms we believe to be thoroughly reliable.



T.C.C. means SAFETY.... ALWAYS

Research — intensive concentrated research — Creating the means to solve the ever present problems of Radio — Rejecting all but what experience has found 100% right. That is the job of the vast T.C.C. organisation—that is why none but the perfect product finds its way to the storeroom. But even more, that is why T.C.C. spells SAFETY at all times. Throughout the world the "condenser in the green case" is synonymous with condenser efficiency—whatever the need there is a T.C.C. to fulfil it—adequately—the reason for the choice of T.C.C. by all the leading set designers.

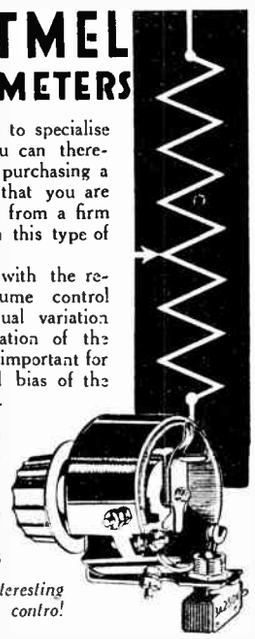
For PERFECT VOLUME CONTROL — WATMEL POTENTIOMETERS

Our Policy this year is to specialise in Potentiometers. You can therefore be certain when purchasing a Watmel Potentiometer that you are obtaining the very best from a firm that is concentrating on this type of component.

This resistance meets with the requirements for a volume control which will have an equal variation of volume for the rotation of the knob. This is specially important for the control of the grid bias of the new variable-Mu valves.



Here is illustrated the Watmel Type 2 Potentiometer with mains switch.

MISCELLANEOUS ADVERTISEMENTS

NOTICES.

THE CHARGE FOR ADVERTISEMENTS in these columns is

12 words or less. 3/- and 3d. for every additional word.

Each paragraph is charged separately and name and address must be counted.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue; 13 consecutive insertions 5%; 26 consecutive, 10%; 52 consecutive, 15%.

ADVERTISEMENTS for these columns are accepted up to **FIRST POST on MONDAY MORNING** (previous to date of issue) at the Head Offices of "The Wireless World," Dorset House, Stamford Street, London. S.E.1, or on **SATURDAY MORNING** at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements that arrive too late for a particular issue will automatically be inserted in the following issue unless accompanied by instructions to the contrary. All advertisements in this section must be strictly prepaid.

The proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders and Cheques sent in payment for advertisements should be made & Co. payable to ILIFFE & SONS Ltd., and crossed & Co. Notes being untraceable if lost in transit should not be sent as remittances.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

PILOT AUTHOR KITS

Exact to Specification

AS FOUNDERS OF CONSTRUCTORS' SETS IN 1919, we have established a world-wide reputation for the supply of Complete Kits and Part Kits for all "Wireless World" Set designs. An essential feature of this Expert Service to the Home Constructor is IMMEDIATE DELIVERY FROM STOCK CASH or C.O.D. of any exclusively specified or difficult to obtain components. Rely on PETO-SCOTT, he always gives fullest satisfaction to every customer.

NEW MONODIAL

RECEIVER KIT

Author's Kit of FIRST SPECIFIED PARTS for RECEIVER PORTION ONLY, less Plymax Chassis, Panel, Cabinet and Valves

Cash or C.O.D. Carriage Paid **£10-19-6**

Extra for Peto-Scott Plymax Chassis as used by the Author, 14" × 12" × 3". Ready Drilled and Assembled with Runners 10 6

Peto-Scott Oak faced Ply Panel, Ready Drilled, 14" × 10" 2 6

RECEIVER KIT "A" as above but with PETO-SCOTT READY-DRILLED AND ASSEMBLED PLYMAX CHASSIS WITH RUNNERS AND PANEL, less Valves and Cabinet. Cash or C.O.D., Carriage Paid, £11-12-0 or Deposit £1-12-0. Balance in 11 monthly payments of 20/-.

POWER UNIT KIT

Author's Kit of FIRST SPECIFIED PARTS for POWER UNIT ONLY but less Plymax Chassis and Valves

Cash or C.O.D. Carriage Paid **£8-13-6**

Extra for Peto-Scott Ready-Drilled Plymax Chassis with Runners, 18" × 6½" × ⅜" ... 7 6

POWER UNIT KIT as above but with READY-DRILLED AND ASSEMBLED PLYMAX CHASSIS. Cash or C.O.D., Carriage Paid. £9-0-0 or 12 monthly payments of 16 6.

BUILD your "Wireless World" Set on the PETO-SCOTT PLYMAX CHASSIS used and specified by the Author.

COMBINED KIT

Comprising Receiver and Power Unit Kits with 2 Peto-Scott Ready-drilled Plymax Chassis with Runners and Peto-Scott Ready-drilled Oak Panel, less Valves and Cabinet. Cash or C.O.D. Carriage Paid **£20-12-0**

or £3-12-0 *Deposit and* 11 *monthly payments of* 35/-.

COMPLETE KIT

Comprising Receiver and Power Unit Kits as Combined Kit but with Valves, less Cabinet. Cash or C.O.D. Carriage Paid **£27-17-0**

or £5-17-0 *Deposit. Balance in* 11 *monthly payments of* £2-4-0.

FINISHED INSTRUMENTS.—Peto-Scott supply all "Wireless World" Sets as finished receivers, Aerial tested. Cash, C.O.D. or H.P. Send for quotation, no obligation. Peto-Scott have specialised in "Wireless World" Kits and finished instruments for 14 years.

MODERN BATTERY FOUR

KIT 'A' Author's Kit of FIRST SPECIFIED COMPONENTS including ready-drilled ply-panel and Peto-Scott assembled and drilled PLYMAX CHASSIS, excluding Valves, Cabinet and Speaker. Cash or C.O.D. Carriage Paid **£8-6-9**

or 12 monthly payments of 15/3.

PETO-SCOTT PLYMAX CHASSIS SOLELY SPECIFIED. Plymax Chassis as specified by the Author, drilled and assembled, 10" × 10". Cash or C.O.D. Post and Packing 1/3 extra. **7/6**

NUMBERED ADDRESSES.

For the convenience of private advertisers, letters may be addressed to numbers at "The Wireless World" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Wireless World." All replies should be addressed to the Box number shown in the advertisement, c/o "The Wireless World," Dorset House, Stamford Street, London, S.E.1. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

DEPOSIT SYSTEM.

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Wireless World," both parties are advised of its receipt.

The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50, 5/-. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.—Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

LOUD-SPEAKERS.

P.M. Speakers Bargain.

LARGE Quantity 8¾in. P.M.M.C. Speakers, made by well-known manufacturer for set maker, highly sensitive, work off any set, 3-ratio transformer; 19/6, post free; money returned if not satisfactory.—Milton Manufacturing Co., Milton St., Coventry. [3415

BTH RK Moving Coil Speakers, guaranteed new, unused, manufacturers' surplus, original price.

6 Guineas, highly sensitive and wonderful tone response, will handle up to 10 watts output, available for 6v., 100v., 200v. D.C., 30/-, also A.C. models.

£2 10; carriage paid, c.o.d. or cash with order; the best value in speakers obtainable to-day.—O. H. Seekamp, First Avenue House, High Holborn, London, W.C.1. 'Phone No.: Holborn 6609. [1425

EPOCH 99K, £3 10; N. and K., dynamic, 25/-; both new. May, 51, Graham Mansions, Hackney, E.8. [3474

10/-.—Lamplugh Silver Ghost, 2,200 ohms, with output transformer, unopened; list 47/6; c.o.d., carriage paid.—Kay, 167, City Rd., London, E.C.1. [3351

ARMSTRONG 1934 Permanent Magnet Moving Coil Speaker, better than ever this year, transformer matched to your requirements; technical advice willingly given; full size speaker, remarkable performance, 21/-; guaranteed; approval.—Armstrong Co., 100, King's Rd., N.W.1. [3468

RADIO DATA CHARTS

A SERIES OF ABACS

providing most of the essential Data required in Receiver Design

By

R. T. BEATTY, M.A., B.E., D.Sc.

Reprinted from "The Wireless World"

(1930)

"Radio Data Charts" provide designers of wireless apparatus with a ready and convenient means of solving problems without having recourse to complicated formulæ and mathematics.

By the use of the charts it is possible to tackle all the more familiar problems in radio receiver design, such as, for example, finding the relationship between inductance capacity and frequency, and working out the design of high frequency transformers. All keen amateurs will appreciate this helpful book.

(30 CHARTS and more than 50 Diagrams)

Loud-Speakers.—Contd.

30/- !!!—B.T.H., R.K. moving coil speakers, 6in. cone, new and unused, guaranteed; these speakers are the type as used in cinema sound equipment; suitable for public address work; weight 30lb., and are vastly superior to the cheap speakers now on the market, 100 volts, 150 volts, and 200 volts D.C.

27/6 !!!—6-volt D.C. speakers, as above; £2 7 6 speaker as above for 100/250 volts A.C., complete with field rectifier.

CARRIAGE Paid, cash with order, or c.o.d.; send for list.—Ward, 12, Tredegar Rd., Bow, E.3. Tel.: Advance 3668. [3489

CHAL ELECTRIC Offer New Boxed Set Manufacturers' Surplus Rola Speakers, all fitted hum buckers, state if Power or Pentode Transformer F6 110-175v. D.C. (2,000 ohms); 90-130v. D.C. (2,500 ohms); 150-200v. D.C. (4,700 ohms); 200-250 D.C. (6,500 ohms), listed at 35/-, at 18/-; F7 voltages as above list, 47 6, at 25/- each; permanent magnets F6P.M., listed at 49/6, at 28/-; F7P.M., listed £3, at 33/-; Ultra 95P.M., a real hefty job with Power-Pentode transformer, listed £4/15, at 47/6; Rola Dual Compensated (2) F6, list £3/10, at £2; (1) F6 and (1) F7, list £4/5, at 47/-; all goods Carriage Paid, Cash with Order, or C.O.D.—Chal Electric, 6, Conduit St., London, W.1. [3221

VALVES.

ALL Classes of Valves in Stock, including American and non-ring valves; send for price list.—R. Newman, 309, Roman Rd., London, E.3. [3446

ALL Types of Valves in Stock, including the following brand new American valves, first-class makes: 247s, 235s, 224s, 236s, 237s, 233s, 245s, 244s, 12/-; 227s, 226s, 280s, 245s, 9/6; 242s, 232s, 11/-; U.X.210s, 15/-; U.X.250s, 7 watts output, 16/-; 281s, 14/6; post paid, cash with order or c.o.d. Send for valve list. Ward, 12, Tredegar Rd., Bow, E.3. Tel.: Advance 3668. [3488

COMPONENTS, ETC., FOR SALE.

R.

SELECTED Parts for Sale, as new; c.o.d. or "Wireless World" deposit system, which we recommend if in doubt as to the splendid value offered; we take risk of damage in transit to our customers; goods tested for callers and guaranteed.

NEW Output Transformers Similar to R. and A., ratio 18/23/32, 6/-; Telsen 0.05 mica condensers, 2/3; T.C.C. 0.01 mica type M, 1/-; new Paxolin formers, 1in., slotted, with guides, 8d.; T.C.C. 2 mf., 350v. working, 1/6; ditto, 1 mf., 1/3, new; T.C.C. 4+4, 250v. working, 4/9.

VARLEY P.P. Input Transformer, 15/-; pairs new Polar twin S.M. thumb drive, 0.0005, complete, 12/6; Telsen 100h. chokes, 3/-; Westinghouse H.T.4 and A4 rectifiers, with Varley transformer, £2; Clyden 0.0005 double thumb twin extenser, 15/6; Clyden single 0.0005 extenser, 7/6; Ready Radio 0.0005 extenser condensers, new, 3/6; Sound Sales 10h. choke, 9/6; Ormond 65/- type P.M. speaker complete, 37/6.

RADIOPHONE Pots with Switch, 5,000, 10,000, 100,000, 25,000, new, 2/6 each; new type Magna speaker, 2,500 ohm and 5,000 ohm, 42/6 each complete; Sonocorde Senior D.C. with 10-watt field, 30/-, complete.

FERRANTI Resistances, with holder, 3,000, 5,000, 15,000, 20,000, 30,000, 50,000, 100,000, 2/6 each; Varley Power, 500, 1,000, 5,000, 10,000, 40,000, 50,000, 3/- each.

TRANSFORMERS, Ferranti A.F.4, 8/-, A.F.3, 12/6, A.F.5, 18/6, A.F.5c, 21/6, O.P.M.1c, 16/6, O.P.M.2, 13/-, O.P.M.4, 16/6; B1 choke, new, 13/-; A.F.6, 18/6, A.F.7c, 22/6.

EDISON BELL 10,000 Eureka, wire wound, with holders, 1/-; Edison Bell 0.0005 universal log all metal condensers, 1/6, new.

AMPLION Public Address Microphone, £3; Ready Radio Senior Instamat matching transformers, new, 10/25/1, 15/9; G.E.C. Senior induction motor, 47/6; set Colvern battery Super Five coils, 10/-; or Colvern single dial super battery coils, 15/-; Mullard H.T. eliminator, complete, 150v. 30 m.a., 240v. input, 30/-; Six-Sixty eliminator, 200v. 25 m.a., and G.B., 32/6; Ekco A.C.25, 47/6; Atlas A.C.244, 39/6.

PAIR Varley Q.P.P. Input and Output, 19/-; Wearite and Lewcos superhet coils, 5/-; 3-range oscillators, 7/6; 8-way bases, 4/6; T.C.C. 2,000 mf. electrolytic, 9/-; T.C.C. ditto, 250 mf., 100v., 8/6; Novatone J., 30/-; Igranic L.F. choke coupling units, 3/9; Lotus new 4-gangs, 15/9.

RYALL'S Mains Condensers, 4 mf., 250v. working, 2/6; 4 mf., 500v. working, 4/6; 4 mf., 750v., 6/6; 2,000v., 17/6; Ryall's condenser blocks, 2+4 mf., 2+2 mf., 500v. working, 8/6; Dubilier 2+2, 500v. working, 2/6.

RYALL'S Mains Transformers, 250v. 60 m.a., 4v. 1 amp., 4v. 3 amps., 10/6; 350v., 12/9; H.T.7, with 4v. 4 amp., 10/6; 4v. 3 amp. only, 6/9; chokes, 25h. at 60 m.a., resistance 260 ohms, 6/9; 20h. at 100 m.a., 8/9; 10h., 8/9, for Monodial; 40h. at 100 m.a., 10/6.

RYALL'S RADIO Offer Reliable Resistances, 1 watt, suitable for all "Wireless World" sets where a 1 watt resistance is specified, in values 100, 500, 1,000, 2,000, 5,000, 6,000, 10,000, 25,000, 30,000, 75,000, 150,000, 250,000, 20,000, all values stated in ohms, 6d. each, guaranteed one year, wire ends, new goods.

WE Hold a Large Stock of First Class Radio Apparatus, meters, resistances, condensers, heavy chokes, and all set requirements, at bargain prices, all modern goods.

RYALL'S RADIO, 33, Chancery Lane, Lond'n, W.C.2 (nearest Tube Chancery Lane; bus 67 passes door, or tram 1 Savoy St.). Holborn 3529. Open Saturday afternoon. Close 7 p.m., Thursdays 1 o'clock, Saturday 6 p.m.

A.1.

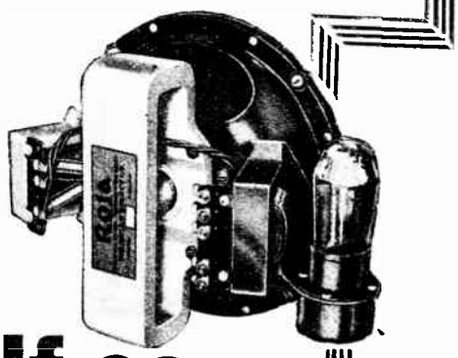
SURPLUS RADIO, Ponders End, offers the following genuine manufacturers' stocks:

DOUBLE Smoothing Chokes, mounted, sound, robust job, 120m.a., 14/28 henrys each, usual price 35/-, our price 6/6 each, 9d. postage; single ditto, 4/6 each.

CHOKES, small, iron-covered, 2,000 ohms, for output or choke coupling; 1/6 each, 3d. postage.

(This advertisement continued in third column.)

QUALITY CLASS B... Are you a Battery Set Owner



If so...

do you know that it takes only 5 seconds to fit a

ROLA CLASS B SPEAKER AMPLIFIER Unit

to any battery receiver and increase the volume 5 times.

Rola speakers are used by the large majority of British radio manufacturers and by nearly all "constructor set" designers. For realistic reproduction and impressive volume maintained year after year they occupy a position of unchallengeable supremacy. Write to-day for the Rola folder.

Model A—
for MULLARD P.M.2B, B.T.H. P.D220, COSSOR 220B, STANDARD 13B1, HIVAC B220, MARCONIPHONE B21, G.E.C. B.21, CLARION B22.

Model B—
for COSSOR 240, FERRANTI HP2, CLARION B24.

PRICE (Both Models without valve) **57/-** Price with Valve 71/-

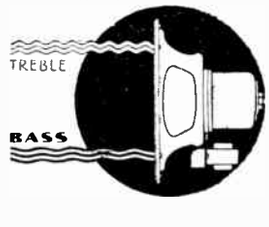
ROLA SPEAKERS *for better Radio Reception*



Components, etc., for Sale.—Contd.

(This advertisement continued from first column.)

A.C. H.T. Eliminator, 220v. to 240, with 4 tappings, total output 150v. at 25m.a., for use with D.W.2 or Phillips 1821 valve, or Westinghouse H.T.6 rectifier; full instructions given.

MAINS Transformers for Eliminators, output 250-0-250 at 60m.a., 4v. at 1 amp.; state input when ordering; price 6/6 each, postage 9d.

14 mfd. Block Condensers, 250v. working, 6-4-2-1-1; 4/- each, postage 6d.

RESISTANCES, wire-wound, finest quality at ridiculous prices:—3,000, 5,000, 8,000, 40,000, 65,000 ohms, all 5 watt, worth 3/6 each; 6d. each, post 3d.

WIRE-WOUND Potential Dividers, 60 watt, wound 3 sections, 4,500 ohms, 3,000 ohms, and 2,000 ohms, 1/6 each, postage 4d.; 5 watt ditto, 20,000 ohms, 20,000 ohms, 20,000 ohms, 1/- each, postage 3d.

POTENTIAL Dividers, wound 2 sections, 5 watt, 40,000 and 23,000 ohms, 40,000 and 80,000 ohms, 40,000 and 100,000 ohms, 30,000 and 50,000 ohms; at 1/- each, postage 3d.

POTENTIAL Dividers, wound 5 sections, 5 watt, 250, 165, 100, 100, 100 ohms; 1/6 postage 3d.

TWO Separate Resistances, 60 watt, on one tube, 2,500 ohms and 500 ohms; 1/6 each, postage 4d.

THREE Separate Resistances on One Tube, 2,500 ohms, 1,000 ohms, 80 ohms; 1/- each, postage 3d.

100,000, 200,000, and 300,000 ohms 1 watt type resistances at 4/6 per dozen, postage 3d.

2 Meg., 0.1 meg., 0.5 meg leaks, 0.001, 0.0001, 0.015 fixed condensers; all 3/- per dozen, postage 3d.

R.C. Coupling Units; 1/- each, postage 3d.

1 mfd. Condensers, 250 volt working, 6d. each, postage 2d.; 4 mfd. condensers, 250 volt working, 1/6 each, postage 4d.

GOODS Order Value 20/- Carriage free.

EACH Article is Tested Before Despatch and Guaranteed First Class Manufacture.

CASH With Order: all goods despatched the same day.—Surplus Radio, 32, Queensway, Ponders End, Middlesex. [3461

PREMIER

PREMIER SUPPLY STORES Offer the following Set Manufacturers' Surplus New Goods at a fraction of the Original Cost, all goods guaranteed perfect, carriage paid over 5/-, under 5/- postage 6d. extra (Ireland, carriage forward).

ELIMINATOR Kits, including transformer, choke, Westinghouse metal rectifier, T.C.C. condensers, resistances and diagram, 120v. 20 m.a., 20/-; trickle charger 8/- extra; 150v. 30 milliamps. with 4v. 2·4 amps. C.T., L.T. 25/-; trickle charger 6/6 extra; 250v. 60 milliamps. with 4v. 3·5 amps. C.T., L.T. 30/-; 200v. 100 milliamps. with 4v. 3.5 amps. C.T., L.T. 49/6; 300v. 60 milliamps. with 4v. 3·5 amps. C.T., L.T., 37/6.

ELLIOTT First Grade Moving Coil Meters in the Following Ranges:—0-10, 0-30, 0-50, 0-100, 0-150 milliamps., also 250v. flush type, 17/6, projecting 15/-.

ROLA Moving Coil Speakers, complete with humbucking coils and output transformer; please state whether power or pentode required: F6, 2,000 or 6,500 ohm, listed 35/-, at 17/6; F7, 2,000 or 6,500 ohm, listed 47/6, at 23/6; A.C. conversion kit for any of above, 10/-.

SPECIAL Offer.—Reisz type microphone with transformer, a really professional job, listed at £12; our price 52/6.

HEAVY Duty Variable Resistances, wound on porcelain, 2,000 ohms 1·4 amp., 5,000 ohms 1·2 amp., 120 ohms 1 amp., all the above values, 3/6 each.

T.C.C. Condensers 750v. working, 2 mf. 3/6, 4 mf. 6/-, 4 mf. 400v. working 4/-, 250v. working 1 mf. 1/-, 2 mf. 1/9, 4 mf. 2/6, 1,500v. working Standoff insulators .5 mfd. 1/6, 2 mfd. 6/-, aqueous electrolytic 440v. working, 4 mf. 3/-, 8 mf. 3/6.

DUBILIER Condensers.—.01 mica 6d., .01 mica 1,000v. working 1/-.

ALL the Following Lines 6d. each or 5/- per dozen: 4 and 5 pin chassis mounting valve holders; shielded screen grid or pentode leads 1-watt wire end resistances, any value; T.C.C. .1 condensers; hum dingers; on-off switches pushpull; polar ganging devices.

FERRANTI Condenser Blocks 300v. working 4+4+2-2, all separate, 5/-.

POLAR 3-gang 0.0005 Condensers, split end vanes, totally screened, dise drive; 6/11.

AMSCO Triple-gang 0.0005 Condensers, with trimmers, 4/11.

ORMOND 0.0005 Condensers, 1/3; 2-gang semi shielded, 2/6.

WESTERN ELECTRIC Mains Transformers, input 200-250 volt, output 500-0-500 volt, at 150 milliamps., 4v. 4a., 4v. 2·5a., 4v. 2a., 4v. 1a., 4v. 1a., massive job; 19/6.

T.C.C. Electrolytic Condensers, 10 mfd., 100 volts working, 1/-; 15 mfd. 1/3.

SPECIAL Offer of Mains Transformers manufactured by Philips, input 100-115v. or 200-250v., output 180-0-180 volts, 40 m.a., 4v. 1a., and 4v. 3a., 4/6; 200-0-200v., 4v. 1a., 4v. 3a., 4/6.

ALL Premier Guaranteed Mains Transformers have engraved terminal strips with terminal connections, input 20-250 volts, 40-100 cycles, all windings paper interleaved.

PREMIER H.T.8 Transformer, 250v. 60 m.a., rectified, with 4v. 3·5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 25/-.

Let this Handbook help you on Mains Problems

Containing many circuit diagrams for the construction of mains units, battery chargers and a unit for energising the field-coil of M.C. speakers, the latest version of the Heayberd Handbook "Mains Power for Your Radio" will prove valuable to all keen experimenters or set-builders. It also contains pages of technical hints and data; details of Mains Units, Kits, Battery Chargers, Amplifiers, Mains Transformers, Chokes and Condensers. If you are interested in the Mains—you will be interested in this Handbook. Fill in the coupon and post to-day with 3d. stamps—a copy will be sent you by return.

"ENGINEERING OPPORTUNITIES" is a 250-page Hand-book that has been prepared after years of patient search into the possibilities of various Engineering Careers. It shows clearly and definitely the way in which you may carve out a successful career in your chosen branch of Engineering irrespective of your age, education or experience.

Among a host of other things, it outlines Home-Study Courses in all branches of Civil, Mech., Elec., Motor, Aero., Wireless and "Talkie." Engineering and shows the way to pass A.M.I.C.E., A.M.I.Mech.E., I.E.E., A.M.I.A.E., M.I.M.T., G.P.O., Matriculation, Civil Service and other Examinations.

"ENGINEERING OPPORTUNITIES" is a unique Hand-book that you should not certainly read. Send for your copy to-day—FREE of any cost.

ELECTRADIX RADIOS, 218, Upper Thames Street, E.C.4.

Components, etc., for Sale.—Contd.

(This advertisement continued from previous page.)

PREMIER H.T.9 Transformer, 300v. 60 m.a., rectified, with 4v. 3·5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26/-.

PREMIER H.T.10 Transformer, 200v. 100 m.a., rectified, with 4v. 3·5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26/-.

PREMIER Mains Transformer, output 135v. 80 m.a., for voltage doubling, 8/6; 4v. 3·4a. c.t. L.T. 2/- extra; Westinghouse rectifier for above, giving 180v. 30 m.a., 8/6.

PREMIER Mains Transformers, output 250-0-250 volts, 60 m.a., 4v. 1·2a., 4v. 2·3a. 4v. 3·4a. (all c.t.), with screened primary; 15/-.

PREMIER Mains Transformers, output 350-0-350 volts, 90 m.a., 4v. 3·5a., 4v. 2·3a. (both c.t.), with screened primary; 15/-.

PREMIER Mains Transformers, output 400-0-400 volts, 100 m.a., 4v. 4·5a., 4v. 2·3a., with screened primary; 15/-.

PREMIER Auto Transformers, 100-110/200-250 volts or vice versa, 60-watt, 7/9; 100-watt, 10/-.

SPECIAL Offer of Manufacturers' Type Transformers, any input, output 250-0-250 volts, 60 m.a., 4v. 1a., 4v. 3a (both c.t.), 8/6; H.T.8 transformer, with 4v. 3·4a. (c.t.), 8/6; with rectifier, 18/6.

AMPLION Mains Transformers, input 100-250 volts, output 350-0-350 volts, 120 m.a., 4v. 5a., 4v. 2a., 6v. 1a. (all c.t.); 17/6.

FILAMENT Transformers, polished and engraved terminal boards, N.P. terminals, 4v. 3·4a., 5/-; 10v. 3a., 6/6; 12v. 1a., 5/-; 4v. 4·6a., 6/6; 14v. 4a., 6/6; 22v. 1a., 6/-; 6v. 2a., 5/-; 9v. 1a., 5/-; 35v. 3a., 15/-.

PREMIER Chokes, 40 m.a., 25 hys., 4/-; 65 m.a., 30 hys., 6/-; 150 m.a., 30 hys., 10/6.

PYE Chokes, 20 or 32 hys., 4/-; Premier multi-ratio output transformers, giving 15 different ratios 7/6.

PREMIER Eliminators, input 200-250 volts, 40-100 cycles, A.C., incorporating Westinghouse metal rectifiers, output 250v. 60 m.a., S.G. and 120v. taps, 42/6; with 4v. 4a. c.t. L.T., 7/6 extra.

BRITISH RADIOPHONE Wire Wound Potentiometers, with mains switch incorporated, 5,000 ohms, 10,000 ohms, 50,000 ohms, 100,000 ohms, 250,000 ohms, any value; 3/6.

PREMIER Eliminators, output 150v. at 30 m.a., S.G., and 100v. taps, with 4v. 3·4a. c.t. L.T., 37/6; or with trickle charger, 42/6.

PREMIER Eliminators, output 120v. at 20 m.a, S.G., and 100v taps, 27/6; with L.T. trickle charger incorporated, 35/-.

PREMIER D.C. Eliminators, output 120v. at 20 m.a, S.G. and 100v. taps; 15/-.

ACCUMULATOR Chargers, 200-250 volts A.C., all incorporating Westinghouse metal rectifiers; 2, 4, and 6v. at ½ amp., 12/6; 2, 4, and 6v at 1 amp., 17/6; 12v. 1a., 27/6; 6v 2a., 35/-; 12v. 2a., 35/-; 12v. 1·5a., 30/-; 6v. 3a., 39/6; 30v. 3a., 42/6.

AMPLION High Inductance Chokes, resistance 2,500 ohms, 80 henries 60 m.a.; 5/6.

WESTINGHOUSE Metal Rectifiers: 120v. at 20 m.a., 6/6; 180v at 30 m.a., 8/6; 8v. at ½ amp., 6/6; 6v. at 1 amp., 9/3.

KOLSTER BRANDES Electric Gramophone Motors, complete with turntables and automatic stop, 100-250v., A.C. and D.C.; list price £5, to clear £2.

B.T.H. Induction Type (A.C. only) Electric Gramophone Motors, 100-250v.; 30/- complete

AMPLION Moving Coil Speakers, type E.M.644, dual fields, 2,500 and 5,000 ohms (100 and 200v.), with output transformer, 12/6; A.C. conversion kit for this speaker, 10/- extra.

WESTERN ELECTRIC Condensers, 250v. working, 1 mfd. 6d., 2 mfd 1/-; 500v. working, 1 mfd., 1/-.

T.C.C. Condensers, 250v. working, 4×4×1 mfd., 3/6; 300v. working, 4×4×2×2×2 mfd., 6/-; 6×4×2×2×2 mfd., 375v. working, 6/11; 4×4×1, 6/-.

SPECIAL Offer of Wire Wound Resistances.—4 watts, any value up to 10,000 ohms, 1/-; 8 watts, any value up to 15,000 ohms, 1/6; 15 watts, any value up to 50,000 ohms, 2/-; 25 watts, any value up to 50,000 ohms, 2/6; 50 watts, any value up to 50,000 ohms, 3/6.

WIRE Wound Potentiometers, 15,000 ohms, 1/6; Centralab Potentiometer volume controls, 50,000 ohms, 2/-; wire wound Clarostat Potentiometer, 50,000 ohms, 2/6; Colverstats, logarithmically wound Potentiometers, 6,000 ohms, 1/9.

FOR Callers only.—The following valves, guaranteed new :—

THE Last Few Western Electric 3211-D Valves, 10v. 3a. filament, 750-1,000v. plate, 50-65 m.a., impedance 3,500 ohms, amplification factor 12; cost £5; to clear at 15/-.

PHILIPS 328 Valves for L.T. Charging, 5/6; 329 Barreter lamps, 2/-.

HARLEY Pick-ups with arm and volume control; 12/6.

PREMIER SUPPLY STORES, 20-22, High St., Clapham, S.W.4. Macaulay 2188. Closed 1 o'clock Wednesdays, open to 9 o'clock Saturdays. Nearest Station, Clapham North Underground.

GILBERT INDUSTRIES' Parcels.

"A," "B," "D," and Condenser Parcels, as advertised in issues August 4th and August 11th, still available by return of post.

GILBERT INDUSTRIES, Ltd., 519, London Rd., Westcliff-on-Sea. [3283

"UNIVERSAL" HIGH-VOLTAGE VALVES

THE ONLY ones which operate direct from FULL MAINS VOLTAGE, either A.C. or D.C., without the use of transformers or resistances, and greatly reduce the cost of running your set. Do not confuse these with valves which can only be wired in series.

S 100. S.G. valve for H.F. stages, L.F. couplings. Very high slope. Great amplification. Impedance over 1 million ohms	18/-
S 25. S.G. valve for Det.—Audio and H.F. stages. High slope. Impedance 250,000 ohms	18/9
MS 18. S.G. Vari-mu, with variable slope	18/9
MS 70. S.G. Vari-mu. Excellent for A.V. control	18/-
D 130. Outstanding characteristics: High-mu. Triode valve. Impedance 40,000. Amp. factor 100	17/6
PT 3. Multi-grid valve. Very remarkable slope and high internal resistance	19/-
K 3580. Output stage amplifying valve. Dissipation 15 watts. Amplification factor 3. Impedance 500 ohms. Remarkable for scale of 6 mA. V.	25/6

Other types and rectifiers as previously listed all in stock. Details on request. Free Blueprint with first order.

SOUTHERN RADIO Wireless Bargains. Set manufacturers guaranteed surplus:

VARIABLE Condensers.—British Radiophone 4-gang superhet type, fully screened and trimmers, 0.0005, 8/9 (list 45/-). Same type, complete with dial knob and escutcheon, 12/9 (list 50/-). Hydra block condensers, new, 16 mfd., 2·2·8·2·1·1, 1,000 volt test (made for Canadian Marconiphone Co.), 7/-; 4 mfd., 2/6; 2 mfd., 1/9; 1 mfd., 1/-; all 750 volt. Polar 3 gang condensers, 0.0005, fully screened, complete trimmers, dial, knob, escutcheon; 11/-.

SPEAKERS, Celestion Soundex permanent magnet, 16/- (list 27/6); Rola F6 permanent magnet, 28/- (listed 49/6); D.C. mains energized, 2,500 to 6,500 ohms, complete with humbucking coils and transformers, 16/6 (list 39/6); Peter Grassman dynamic speakers and chassis, 10/6 each (list 35/-); G.E.C. Stork speakers, complete in magnificent cabinet, 19/6 (listed £3/15); Ormond speakers, complete in cabinets, 10/- (listed 25/-). Dr. Nesper Tefag speakers, 11/6 (listed 55/-).

CONSTRUCTORS' Kits. Ready Radio "303" battery 3-valve kits, less valves, 18/- each; complete with 3 Mullard valves (P.M. 1H.F., P.M.2, 2D.X.), 33/- each (list 70/-); Ready Radio Meteor screen grid 3-valve kit, less valves, 26/-; with 3 Mullard valves (P.M.12a, P.M.2D.X., P.M.2a.), 49/- (list £5 7 6); Universal Radio 3-valve kits, ready assembled on chassis, 12/6 (listed 45/-); 4-valve, metal chassis only, 11in. × 9in. × 3½in. (deep), 2/6 each, brand new.

READY RADIO S.T.400 Kits, as specified by Scott Taggart; £2 10 6 each (list £4 17 6).

MULLARD RADIO for Million 3-valve A.C. Kit, complete with 3 Mullard A.C. valves (Pen. 4V., 354V., 8.4V.), £3 10 (list £6 10); Mullard Radio for Million 3-valve battery kits, complete with 3 Mullard valves, £3 3 (list £6.2 6); all kit brand new, in original sealed cartons.

BRITISH General Tuning Units.—Band Pass, 10 k.c., aerial or anode; 5 (list 14 6); Metro-Vick and Atheo resistances, all capacities, 3 9 per doz. assorted; H.M.V. tone controls, 1 6 each (list 12 6).

ALL Goods Guaranteed New and Perfect, and sent carriage paid.

PLEASE Note, We have opened branches at 271-275, High Rd., Willesden Green, N.W.10, and at 46, Lisle St., W.C.2, where callers are cordially invited to inspect our large stocks of wireless bargains. Please send all post orders to 323, Euston Rd., N.W.1.

SOUTHERN RADIO, 323, Euston Rd., London, N.W.1 (near Warren St. Tube). 'Phone: Museum 6324. [3481

M.R.D. Co.'s Guaranteed Surplus; carriage paid or call; 10% discount on orders over 10/-.

DUBILIER and Giverte Half-Watt Resistors, as last week, 4d. each, 1/9 half-dozen; Benjamin 5-pin chassis valveholders, 1/3 half-dozen.

POLYMET Mica Fixed Condensers, all sizes, 0.0001 to 0.01, 3d. each, 1/3 half-dozen; 1 mfd. 400v. working, 10d.

T.C.C. 2 mfd. Electrolytics, 100v. working, 9d.; T.C.C. 4·4 mfd., 250v. working, 3/3; T.C.C. 4·8·4·1·1 × 5 mfd., 250v. working, 3/11.

FORMO 0.0003 Condensers, 8d.; Varley 250,000 pots, 1/7; Pye L.F. chokes, 32h. 60 m.a., 4/6. Mains Radio Development Co., 4-6, Muswell Hill Rd., London, N.10. [3483

PEPPER Offers the Following Under Usual Money-back Guarantee; carriage paid over £2.

BAKERS 1933 S.P.P.M. Speakers (listed £6 6), complete, £2 15; ditto, 1931 model, £2 3; Magnavox Magna, D.C.142, 2,500 field, boxed, £2 15; Amplion E.M.644, 14 6; Farnet, 2,500 field, 15/-.

JUNIT Baby Super Transformer (for H.T.9), 18 6; Westinghouse H.T.9, H.T.10, H.T.1 rectifiers, as new, 10/6 each; H.T.4, H.T.6, 7/6.

ACCUMULATOR Chargers, by Supremus, etc.; 6 volts 1 amp., 17 6; 12 volts 1 amp., 26/-; 24 volts 1 amp., 34/6; 6 volts 1½ amps., 12 6; 15v. 2 amps., 59 6; above Westinghouse rectified; 28 volts 1.3 amps., complete with meter and valve, £1 18 6.

MARCONI 63/- Pick-ups, as new, 25 6; Limit pick-up heads, 7 11; Lumine Phonovox pick-ups, with arms, 8/11; Bulgin ditto, 12 6; Garrard Hg. motors, with turntable, etc., new, 14/6.

ELIMINATOR Kits (A.C.), smoothed output 500v. 120m.a., Westinghouse rectified, including B.T.H. transformer, etc., £3/15; similar kit, valve rectified, £2 10.

QUANTITY of Lewcos, Wearite, Igranic, etc., volume controls at half list.

TREVOR PEPPER, 575, Moseley Rd., Birmingham, 12 [3464

CAMBRIDGE Unipivot Galvanometer, test certificate, brand new; list £9 10, price £5 10.

FOLLOWING Ferranti's Half List Price: A.F.1, volts 0-10-100-300, milliamps 0-10-100, in case, list £6.10; 0-10-250 volts, 100 milliamps, list £3/10; both above moving coil instruments; 0-600 volts Electrostatic, list £3 5; R.T.5 resistance tester, 0-5,000-50,000 ohms, list £4.15.

NO-RO-CO Converter, 200-250 D.C. to 200-250 A.C., 90 watts, work 2-valve to 9-valve set; £3 10.—20, Albion Terrace, Blackwood, Mon. [3458

CHAL ELECTRIC Offers New Set Manufacturer's Surplus, all carriage paid; cash with order or c.o.d.

VARIABLE Condensers.—J.B. Nu Gang (3-gang), complete with disc drive, covers, trimmers, escutcheon, light knob, etc., 17/6; 2-gang, fitted as above, 9/6; Polar Star (3-gang 1933), complete, fitted as above, list 30/6, at 18/-; Uniknob 2-gang, fitted as above, complete, 10/-; Utility 2-gang, fitted as above, 8/6.

COILS (6 sets each only).—Colvern Ferrocart, F1, F2, F3, ganged, 32/-; Varley Ni-core (1), B.P.30 and 2B.P.31, 28/-; Varley sets, B.P., 19 ganged, 25 6.

(This advertisement continued in third column.)

Now the Show is over....

and reflection is the order of the day, there is no doubt that the "W.W."

NEW MONODIAL

will be the choice of the radio connoisseur.

IN response to many queries last month, we are again offering our Monodial constructional and servicing facilities to readers in all parts of Great Britain. Consult us NOW! You will benefit by our condensed experience gained in building and servicing sets for "W.W." readers during the *last 7 years*.

Our Workshops test apparatus has been considerably augmented and we are ready to build for you a de-luxe NEW MONODIAL and if necessary to fit it in a period cabinet, and to supply and instal all necessary associated components. If desired, any apparatus can be supplied for a first deposit of 12½% with the balance over 1 year.

This extract from a letter entirely unsolicited regarding the original Monodial, is illuminating.

"I should like to place on record my appreciation of the excellent job you have made of the Monodial Superhet set which I recently ordered from you. Results have been most pleasing and I am highly satisfied with the whole outfit . . . . . I shall have great pleasure in recommending your Firm to any of my friends . . . . . "

Components, etc., for Sale.—Contd.

(This advertisement continued from first column.)

SMOOTHING Condensers.—C.E.C. Murphy, etc., 800 test 250 A.C. working, 1 mfd. 1/1, 2 mfd. 1/9, 4 mfd. 2/6; all the following 1,500 D.C., test 500 A.C., working 800 peak, 1 mfd. 1/9, 2 mfd. 2/4, 4 mfd. 4/-; Multiple Banksall, separate tappings, 20 mfd., 4+4+2+2+2+2+2+1+1 at 11/-, 11 mfd., 4+2+2+2+1, at 6/9.

CHOKES.—30 henry 30 m.a. (500 ohms.), 6/-; 30 henry 50 m.a. (450 ohms.), 6/3; 30 henry 60 m.a. (600 ohms), 6/6; another (300 ohms), 6/9; 30 henry 75 m.a. (300 ohms), 6/9; 50 henry 60 m.a. (850 ohms), 8/6; 20 henry 120 m.a. (325 ohms), 10/6.

MAINS Transformers.—All tapped and screened primaries, L.T. windings C.T.: 500-0-500, at 120 m.a., 4v. 2.5a., 4v. 5a., 4v. 2a., 21/-; 350-0-350 at 120 m.a., 4v. 2.5a., 4v. 4a., 4v. 1a., 19/-; 250-0-250 at 75 m.a., 4v. 1a., 4v. 5a., 12/6; 250-0-250, 60 m.a., 4v. 1a., 4v. 3a., 4v. 1a., at 12/-. Note.—All transformers, chokes and condensers guaranteed against breakdown for 12 months.

RADIO Gramophone Cabinets, Marconiphone 535, walnut, 40½ × 19½ × 16, take chassis up to 39½ × 18½ × 14½, cost to make £8, at £2 12 6.

ASK for Special Quotation for Anything You May Need. —Chal-Electric, No. 6, Conduit St., London, W.1. [3442

EBURY BRIDGE RADIO Co. Offer the Following Stupendous Bankrupt and Set Manufacturers' Surplus Bargains.

A.C. H.T. Eliminators, 200 250v. input, 150v. 30 m.a. output, 2 pos. tappings, one fixed, one variable, Westinghouse rectified, finest components, guaranteed, special summer price, 25/-; 3 pos. tappings, for S.G., 28 6, post 1/3; also in 100 110v.

D.C. Mains High Tension Eliminators, 200 250v. input, output 150 volts 30 m.a., 2 pos. tappings, one variable, 10/-; 3 positive tappings, for S.G., 12 6; post 9d.

GENUINE Reisz P.A. Microphones for all Amplifiers up to 60 Watts, straight line response, 52 6; transformer, 5/-; nickel plated stand, with rubber suspension, oxy base, 12 6; post 1/-.

EX Ekco Mains Transformers, suitable Ferrocart III, tapped input 200 250v. 50c., outputs 350-0-350v. 70 m.a., 4v. 2a., 4v. 3 4a. C.T.; 9 6, post 9d., a real bargain; few only.

EX Ekco Smoothing Chokes, 50h. 50 m.a., C.T.; 5/6; post 6d.; few only left.

PHILIPS Mains Transformers, at ridiculous prices, input 200 250v., outputs 200-0-200v. 40 m.a., 4v. 1a., 4v. 3-4a.; 4 6; post 9d.

PHILIPS Heavy Duty Smoothing Chokes, 50h. 75 m.a.; 4/6; post 9d.

SPECIAL Summer Offer of Ebury Electric Clock Movements, 200 250v. 50 cycles; special slow speed motor; write for full details; 16/6; post 6d.; this offer soon closing.

CONDENSERS.—T.C.C.'s 3 M.F., 800v. working, 5/-, post 6d.; 4 M.F., 500v., 2 3, post 3d.; 15 M.F., 100v. working, for auto G.B., 1 3, post 3d.; 9 M.F. (4+4+1) 500v., 5/-, post 6d.; Wego's 9 M.F. (4+2+2+1) 500v. 3/6, post 6d.; 2 M.F., 1,000v. 2/-, post 3d.; in perfect condition.

CHASSIS Mounting Valve Holders, 4- and 5-pin, 3d. each, 2 6 doz, post 1½d. and 2½d.; Dubilier resistances, vacuum, 5 watt, 50,000 and 100,000 ohms, 1/- each, post 1½d.; Pye ½ watt wire wound 10,000, 7,500 ohms, 4½d.; Globar metallized 500 ohm, 2 watt, 6d., post 1½d.

ROLA F6 Moving Coil Speakers, 6,500 ohms, pentode; 14/-; A.C. mains, 24/-; post 1 3.

MARCONI 2-valve A.C. Mains Amplifier, 5 Watts output, 100/250v. input, 500v. H.T. screening covers; a real bargain, 60/-; few only.

B.T.H. Universal Gramophone Motor, auto stop, £3/3; K.B. Kedra 3-valve A.C. all mains set, housed in fine cabinet, £6 6; in perfect order.

CELESTION Soundex P.M.-M.C. Speakers, 13/6, post 1/-; Celestion Soundex cabinet speakers, P.M., 25/-, post 1 3; Lamplough Silver Ghost, D.C. mains, M.C. speakers, 2,200 and 6,500 ohms, 10/-, post 1/-; Blue Spot 100U inductor speakers, new, boxed, 13 11, post 1 3; Lamplough inductor speakers, list £3/10, 27/6, post 1 3.

READY Radio Short Wave Coils, 1 6, post 6d.; twin lead cable, 1,004, 11/6 50 yard coil.

MARCONI 531 Radio Grum Cabinets, few only, £4/4; Atlas Consolette cabinets, take set, batteries, and speaker, 9 11; post 1/3.

SOVEREIGN 3-valve Battery Set, complete with speaker, valves, and batteries; complete, £5 3.

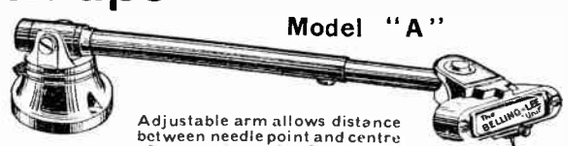
Belling-Lee Pick-ups

LET YOUR EAR BE THE JUDGE!

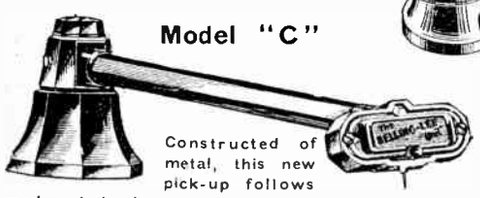
Model "A"



Adjustable arm allows distance between needle point and centre of base to be varied from 7½" to 9¼". The arm should be as long as cabinet space permits. Head angle is also adjustable to obtain minimum tracking error for different arm lengths. List No. 1096 **27/6**

Special Features.—Perfectly natural frequency response . . minimises needle scratch while retaining high notes and brilliancy of reproduction . . Minimum record wear . . Copper screened flex.

Model "C"



Constructed of metal, this new pick-up follows modern design in appearance and technique. Octagon in form, self-contained Volume Control, Ball Bearing Swivel. The whole arm rotates 180° to facilitate needle changing and simultaneously lifts to swing clear over the record. Complete with template. List No. 1117 **35/-**

FERRANTI A.F.4, 7/9; A.F.5, 18/6; O.P.M.2c, O.P.M.5c, O.P.M.2, 14/-; O.P.1, O.P.3c, O.P.6c, 7/6; B.1 choke, 10/-; Varley "Rectatone," 9/-; set 4 Lewcos Century Super coils, 18/-; single coils, 4/-; Varley push-pull transformers, input and output, 13/6 each; Wecrite I.F. transformers, 4/-; B.T.H. Minor pick-up, 16/6; Mullard H.T. A.C. unit, with valves, £1 17/6.—Bostock and Stonmill, 1, Westbourne Terrace, S.E.23. [3467

H.D. RADIO ELECTRICAL SERVICE Offers Surplus of a Set Manufacturer, every article guaranteed new. Moving coil speakers: Magnavox, type D.C.144, 2,500 or 7,500 ohms, with Multi Ratio transformer, at 18/-; type D.C.142, same voltages, at 25/-, complete with universal transformer; Sonochord, all voltages, F.S. type (state requirements), list 25/-, at 17/6, with Universal transformer. Pick-ups, G.E.C., complete, list 27/6, at 15/-; variable condensers, J.B. Nu-gang, complete in every detail, disc drives, 2-gang 10/-, 3-gang 17/6; chassis constructed to specification and sprayed; radio repair specialists to the trade and public; send S.A.E. for quotation; all goods carriage paid; cash with order or C.O.D.; callers only between 1 and 6 p.m.—H.D. Radio Electrical Service, 31, George St., Hanover Sq., London, W.1. [3459

CLASS "B" COMPONENTS.

SOUND SALES, Ltd., for Class "B" Components. List "B.B." on request.—Tremlett Grove, Highgate, N.19. [0401

MISCELLANEOUS.

EASY Payments.—We supply, by easy payments, components, accessories, and sets, any make; 10% down, balance spread over 11 months.—Send list of requirements to London Radio Supply Co., 11, Oat Lane, London, E.C.2. [0337

ENGINEERS and Technical Workers of All Kinds.—A proper training by post in your spare time will take you through your right examination, the employment is waiting. Our advice on all careers free.—Dept. 92, The Bennett College, Ltd., Sheffield. [0395

AMBITIOUS Men.—Qualify for a well-paid post by studying at home with the T.I.G.B. Write to-day for "The Engineer's Guide to Success," 144 pages, free, which contains the widest selection of engineering and wireless courses in the world, and shows you how to become A.M.I.E.E., A.M.I.Mech.E., A.Rad.A., etc. State branch, post or qualification that interests you.—The Technological Institute of Great Britain, 82, Temple Bar House, London, E.C.4. (Founded 1917. 19,000 successes.) [3398

PATENT AGENTS.

PATENTS and Trade Marks, British and foreign.—Gee and Co. (H. T. P. Gee, Member R.S.G.B. and A.M.I.R.E.), 51-52, Chancery Lane, London, W.C.2. 'Phone: Holborn 1525. [0001

REPAIRS.

SEND Us your Receiver for free quotation; overhauling, rebuilding, repairing or conversion to Class B.—Unit Radio, 12, Pulteney Street, Barnsbury, London, N.1. [3456

REPAIRS.—Rebuilding to any set; highest quality work only; lowest charges; estimates given free; distance no object.—L. Eastwood, Radio Manufacturers' Consultant, Late of His Master's Voice and Marconi Wireless Telegraph Co. Telephone: Clerkenwell 4520. Address: 60, Horder Rd., Fulham, S.W.6. [3345

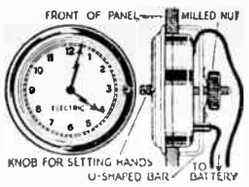
GUARANTEED Repairs by Experts; specialists for repairs to S. G. Brown and Amplion radio apparatus, also loud-speakers, headphones, pick-ups, Blue Spots, any type rewound, remagnetised and adjusted; 4/-; post free; mains transformer repairs; terms to trade.—Howell, 91, Morley Hill, Enfield, Middlesex. [9716

REPAIRS to Loud-speakers, transformers and headphones, 4/-; Blue Spots or Wufas, 5/-, post free; moving coils a speciality, new cones fitted; eliminators and mains transformers quoted for; prompt service; satisfaction guaranteed; discount to trade.—Loud Speaker Repair Works, 5, Balham Grove, London. Battersea 1321. [0396

TUITION.

R.T.I. Training Methods are Recognised; write for particulars of home study for radio appointments; secure "Certificate of Proficiency" and become "A.M.R.T.I."—Radio Training Institute, 85, New Oxford St., London, W.C.1. [2947

QUALIFIED Radio Engineers are Always in Demand, and our Home Study Course will enable you to qualify for a good post; many students already placed this season; prospectus free.—Northern Counties Wireless School, Preston [0399



FIT THIS ELECTRIC CLOCK TO YOUR SET!

NO MAINS NEEDED! KEEPS CORRECT TIME! NO WINDING!

Works off small battery lasting 12 months, or can be plugged into G.B. Battery without affecting reception. Uses practically no current. Fits into hole 3¼" dia. in any panel up to ⅛" thick. Easy to fix—no screws required. Only ⅞" from front of panel to back of case. Swiss movement. Hands set from front. Nickel plated bezel. Useful addition to any set.

RIVERSIDE MFG. CO., LTD.,
Dept. 29, Crisp Rd., Hammersmith, W.6
Telephone: Riverside 0392.

HARKEN!!

●CHANGE OF ADDRESS●

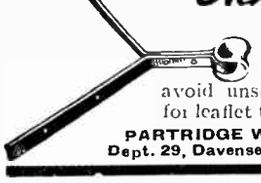
We have removed to larger premises and increased our equipment in order to cope with the growing demand for special apparatus.
May we quote you for Power Amplifiers, Transformers, Coil Winding by automatic machines, Photo-Electric Cell Amplifiers, and all types of special radio and electrical sound apparatus?

TROPICAL APPARATUS A SPECIALITY.

All our work is backed by 25 years' Communications Engineering experience.

THE HARKEN ELECTRICAL CO. LTD.,
Manufacturers of High-Grade Radio & Electrical Apparatus.
●18a, SOUTH END, CROYDON●
Telephone: Fairfield 4772. Telegrams: HARKEN, Croydon.

Gripplesheil Aerial Brackets



are simple and economical to install and avoid unsightly poles. Write for leaflet to:—

PARTRIDGE WILSON & CO.,
Dept. 29, Davenset Works, Leicester.

MODULA

ARMCHAIR CONTROL.

In last week's advertisement, page 14, we stated that with armchair control the price was 4/-. This should have read with armchair STRAP, 4/-.
The MODULA CONTROL without strap is 2/11.
From all Wireless Dealers or
BRITISH PIX CO., LTD.,
118, Southwark Street, London, S.E.1.

EXCHANGE.

HIGH Allowances Made on Second-hand Goods in Part Payment for New Sets or Components; easy payments available; we have tremendous stocks tested second-hand goods; send list of your requirements for quotation.—Bostock and Stonmill, 1, Westbourne Terrace, S.E.23. [3466

WANTED.

A.C. Eliminator, with charger, Atlas preferred; cheap.—Williams, 11, Bedford St., Plymouth. [3479

SPOT Cash for Modern Components, etc.—Economic Radio Co., 96-98, South Lambeth Rd., S.W.8. [3291

NEW or Second-hand Sets, kits, and parts bought, sold, exchanged; best prices allowed.—R. Wigfield, Furlong Rd., Goldthorpe, Yorks. [3470

HIGH-Class Radio Parts and Sets Wanted for cash, new or second-hand, any quantity; send yours stating reasonable price cash by return; retailers' stocks purchased.—Mildmay Radio Exchange, 24, Mildmay Grove, London, N.1. 'Phone: Clissold 5001. [3453

SITUATIONS VACANT.

IF You Wish to Enter the Wireless Profession with a Thorough Training, or if you wish to improve your present position, you will need the certificate issued by Britain's leading wireless college. This is not a correspondence college. Apparatus of all leading makes installed for instructional purposes. Boarders accepted. Training fees can be paid after appointment. Prospectus free.—Wireless College, Colwyn Bay. [0383

SMART Lads Wanted, 14-16.—Apply M. A. Mason and Co., Ltd., W.T. Works, Collingwood Rd., Sutton, Surrey. [3475

OPPORTUNITY Occurs for Bright Young Man of Pleasant Disposition, with some knowledge accumulator charging and radio, to fill junior post in service dept.; preferably owning motor cycle.—Melody Shop, Maidenhead. [3476

JUNIOR Technical Assistant Required for Experimental Work in Connection with Radio Valve Development; applicants should have passed the London Intermediate B.Sc., or higher school examination with physics as one subject. Apply by letter, stating qualification, experience and age, to Ediswan, Ltd., Worple Rd., Isleworth, Middlesex. [3484

SITUATIONS WANTED.

PUBLIC Schoolboy, 22, physics degree, musical diploma, at present in Government service, desires change of occupation.—Box 8075, c/o *The Wireless World*. [3472

BOY, 18, just left school, desirous of starting in radio firm; will take evening institute study in radio technology, etc., in conjunction with same.—Wilson, "Wakefield," Chatsworth Rd., S.E.27. [3478

BOOKS, INSTRUCTIONS, ETC.

300 Clean Issues "Wireless World," to date; 15/-.—Turner, 13, Albert Rd., Mitcham. [3486

THE POLYTECHNIC,
REGENT STREET, W.1.

ELECTRICAL ENGINEERING DEPARTMENT.
WIRELESS AND HIGH FREQUENCY SECTION.
Evening Session, 1933-34.

Courses and Classes, including laboratory work, in WIRELESS AND HIGH FREQUENCY ENGINEERING extending over a period of FIVE YEARS and suitable for those engaged in, or desirous of entering, the Radio, Gramophone, or Talking Film Industries.

Courses prepare for the Graduateship Examination of the I.E.E. and City and Guilds Grouped Course Certificates.

Session commences September 25th, 1933.

Enrolments: September 18th to 22nd, from 6 to 9 p.m.

Full particulars and prospectus from the Director of Education.

CRAMMED WITH EXTRA CHEMICALS!

—and MERCURY means enormously increased LIFE!

THE life of a battery is the life of its cells. That is where the Grosvenor MERCURY process works such wonders. It guards the cells against corrosion—makes them last so long that they are crammed by hydraulic pressure with extra chemicals to use them up.

Next time you buy a battery, remember the amazingly long life, the extra reserves of power that are packed into Grosvenor. Insist on Grosvenor—***and get the most for your money!***

Grosvenor Mercury Batteries are made in three grades *for every Radio need:*

Grosvenor Red Line ..... 5 6 to 11/-
Grosvenor Brown Line ..... 6- to 15 6
Grosvenor Blue Line ..... 7- to 20-

EDISWAN

This Ediswan H.T. Battery cell reveals the secrets of extra H.T. service

1 *A brass cap tightly affixed to the carbon rod forms the positive connection.*

2 *The cell is sealed by means of a waxed washer over which paraffin wax is poured. This washer assists in centralising the sac in the cell.*

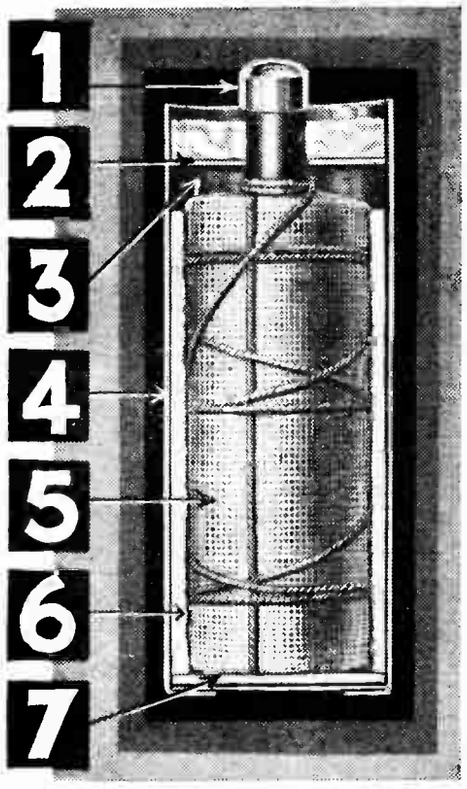
3 *An air space is left between the top of the sac and the washer to allow for the expansion of the electrolyte during discharge.*

4 *A substantial zinc container which forms the negative pole of the cell.*

5 *The sac consists of a highly efficient depolariser, tightly compressed round the carbon rod, the whole being securely wrapped and tied.*

6 *Electrolytic paste of a special chemical composition which fills the space between sac and zinc container and activates the cell.*

7 *A waxed paper disc which insulates the sac from the bottom of the zinc container.*



Don't risk wasting your money on inferior batteries. Insist on Ediswan. You can get them in all standard sizes including portable types—Standard or Super Capacity—at the usual prices.

Harmony

An elusive, subtle quality is Harmony; a tranquil backwater in the upper reaches of the mind; a blending of things beautiful with things practical.

One finds it in R.G.D. Radio Gramophones, wherein the beautiful is wedded with the practical.

Here the traditions of fine craftsmanship find full expression in superb cabinetwork, and mechanical design and ingenuity contrive to produce the ideal means for reproducing speech and music.

The R.G.D. is a thing of beauty and utility; a treasured possession in a thousand homes; the instrument you cannot fail to admire, and to eventually possess.

Ten models comprise the R.G.D. range of Radio Gramophones, and prices are from 48 to 105 Guineas. They have been aptly described by the "Daily Mail" as the "Aristocrats of the radio world."

The leading radio stores and piano salons display R.G.D. Radio Gramophones and will gladly demonstrate.

Write for fully descriptive Catalogue of the complete range of R.G.D. Radio Gramophones and Extension Loud Speakers.

"My dear Watson . . . !

. . . IT IS OBVIOUS THE VALVE HAS GONE . . "

" It took me only a very short time to discover that—thanks to the 'All-in-One' Radiometer. With this invaluable instrument to help me I'll guarantee to track down any trouble in a few minutes."

The "All-in-One" Radiometer is essential to every radio user. It tests everything, locates faults instantly, and helps to keep any set in 100% condition.

Ask your radio dealer about it, or write direct to PIFCO LTD., High Street, MANCHESTER, or 150, Charing Cross Road, London, W.C.2.

PIFCO ALL IN ONE RADIOMETER

Standard Model "All-in-One" Radiometer, for Battery Sets only, as shown here. Price **12/6**

De Luxe Model, for Battery Sets, Electric Receivers and Mains Units. Price - - - **£2:2**

R3

DAVENSET TRANSFORMERS

Home set constructors will find no more reliable components than DAVENSET Transformers. Their recurring specification in many well-known sets is evidence of their high standing in the opinion of the acknowledged radio experts.

Write for a copy of "Mains Transformers and Power Smoothing Chokes for Radio and Industrial Purposes."

PARTRIDGE, WILSON & CO.

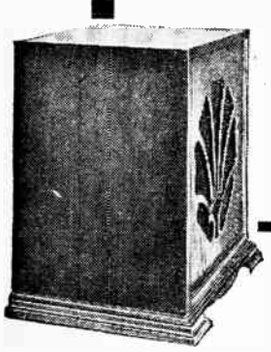
Dept. 29, Davenset Works, Leicester.

Scottish Branch: 200, St. Vincent Street, Glasgow, C.2.

TONE....

The responsibility of reproducing music and speech, clear and sharp without distortion, rests not with the speaker alone but with the cabinet it is housed in. To get the best out of a speaker it is essential to have depth in the cabinet—that's where the Camco No. 2 "Melodee" scores. It measures 12in. from back to front and gives the same effect as a large baffleboard but without booming.

Supplied in Oak, **30/-**. Mahogany and Walnut, **33/-** complete with baffleboard, having hole cut to suit requirements.



See it at our Showrooms and send for a copy of the new Camco Cabinet Catalogue containing particulars of complete range. CARRINGTON MFG. CO. LTD. Showrooms: 24, Hatton Garden, E.C.1.

'Phone: Holborn 8202.
Works: S. Croydon.

Silent in operation

Individually tested and packed. *Plus unrivalled quality*

DUBILIER RESISTANCES

These new Dubilier Resistances are the outcome of an improved process of manufacture which ensures an even better resistance than the popular Dubilier Type of 1932. Consistency of characteristics under prolonged load is a most noteworthy feature, and you are always assured of long life and silence in operation. Undoubtedly the finest resistances selling to-day.

Write for your copy of the new Dubilier Catalogue!

10th NORTHERN NATIONAL RADIO EXHIBITION

CITY HALL, DEANSGATE

MANCHESTER

★ Sept. 27th—Oct. 7th, 1933 ★

The Exhibition will open officially on Wednesday, September 27th, and afterwards

DAILY FROM 11 A.M. to 10 P.M.

The opportunity provided by this Exhibition to see and hear the latest in Radio has been eagerly awaited by thousands of enthusiasts.

Second only in size and importance to Olympia, this exhibition has made a greater appeal than ever to the Trade, the leading Manufacturers and Distributors having secured stand accommodation.

This Exhibition offers an opportunity to see, under one roof, all that is new in the world of radio.

CHEAP RAILWAY FACILITIES

Arrangements have been made with the Railway Companies for the issue of reduced Railway Vouchers for distances within 60 miles radius of Manchester. This Voucher entitles the holder to travel at single fare for the return journey, and is available on the day of issue only. Applications to be made to Provincial Exhibitions, Ltd., City Hall, Deansgate, Manchester, and accompanied by stamped; addressed envelope.

Organised by the

RADIO MANUFACTURERS' ASSOCIATION AND PROVINCIAL EXHIBITIONS LIMITED

There's NOTHING *to equal* BLUE SPOT MOVING COILS

Only by insisting on a Blue Spot moving coil speaker are you absolutely *sure* of satisfaction. Blue Spot Speakers are the best in the world. They have the highest reputation for quality and reliability. They incorporate the most advanced ideas in the best and most convenient way. They give the most lifelike reproduction and so bring out the full values of the broadcast programmes. It is a good investment to buy extra Blue Spot Speakers and use them throughout the house from your present set. There are Blue Spot Speakers for every purpose.

Write for Catalogue No. W.W.81.S.

Some Reasons for Blue Spot Superiority

1. **POSITIVELY NO FOULING IN THE GAP.**
   Blue Spot moisture proof Cones and Speech Coils absolutely eliminate all possibility of warping or fouling in the gap.
2. **EXCLUSIVE MAGNETS.**
   Specially designed high quality magnets ensure powerful and permanent energy and complete reliability.
3. **UNIVERSAL TRANSFORMERS FOR ALL OUTPUT STAGES.**
   Terminals or plugs and sockets in place of solder tags for ease in valve matching. No danger of damaging windings with soldering iron. No troublesome switch contacts. All output stages including Class B. Matched in a moment. Q.P.P. Pentode 2/6 extra.
4. **DUST PROOF SIDE PLATES.**
   Special dust proof side plates preventing dust and magnetic particles being attracted into powerful gap.

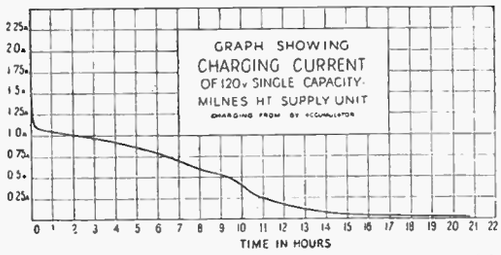
gives

65-70%

WATT-HOUR Efficiency

No other form of H.T. Supply of any type can show so high a degree of efficiency. The charge and discharge curves reproduced are illuminating and are typical of every Milnes Unit. Furthermore, this efficiency is maintained indefinitely. Year after year—for twenty years and more, the Milnes Unit will function with unfailing regularity and perfect consistency.



GRAPH SHOWING CHARGING CURRENT OF 120v SINGLE CAPACITY MILNES H.T. SUPPLY UNIT
CHARGING FROM D.C. ACCUMULATOR
TIME IN HOURS

The Milnes Unit will serve the largest set. It will stand almost any rate of discharge. (Even dead shorting will not harm the nickel-cadmium plates). *Overnight the Milnes Unit regains its fully charged condition by drawing current from the L.T. accumulator*—automatically, without need for watching or timing and without wasting a milliamp of current. The constant voltage, steady flow and dead silent background make the Milnes Unit ideal for quality reproduction and short-wave work. It gives punch and dependability equal to the mains with the purity of a brand-new dry battery. The Milnes Unit is a sound engineering production—proved by 15,000 users over 5 years. It stands for a definite and permanent solution of all H.T. problems. Ask your radio dealer to demonstrate, or send the coupon to-day for free descriptive book.

SAVAGE SOUND REPRODUCTION EQUIPMENT

A NEW SAVAGE Amplifier

The Panel Type Cabinet 320

Backed by the world-wide Savage reputation for reliability comes this New Savage Amplifier. It is constructed on a vertical Metal Panel with Valves and Controls in front and all other components behind. One of the principal advantages of this method of construction is that all components are extremely accessible. No cost has been spared to make this a luxury outfit of sturdy build. It is extremely compact and readily transportable. The Strong Oak Cabinet includes Panel 320, Volume and Tone Controls, Micro-Gram Switch, Microphone Transformer and Battery, Two Microphone positions with switching, Single Turntable and Pick-up as illustrated **£34.** Can be supplied without Turntable and Pick-up **£27.10.0** or with double Turntable and two Pick-ups **£41.** Tropical models £1 extra.

Undistorted Speech Output—20 watts approx.

Read what "The Wireless World" says about the

WHARFEDALE
MOVING COIL SPEAKER

(Sept. 8th, 1933 issue)

"The Units submitted for test were the 'Bronze' and 'Golden' models. Both are notable for their rugged construction and the generous dimensions of the magnet systems. A notable feature is the method which has been adopted to ensure the exclusion of foreign matter from the air gap. Particles falling in towards the apex of the cone are stopped by a fine mesh gauze behind the centring spider, while the back of the gap is sealed by a sponge rubber ring surrounding the centre pole-piece. As regards frequency response the 'Golden' model has a better output in the bass below 100 cycles on account of its larger diaphragm, and in the extreme top its higher price is again justified. In both models there is an appreciable response at 8,000 cycles, but whereas the 'Bronze' model commences to fall off at 4,000 cycles, the output of the 'Golden' model is fully maintained up to 5,000 cycles. The bass resonance occurs in the 'Bronze' model at 145 cycles and in the 'Golden' at 120 cycles, but in neither case is it sufficiently prominent to colour the quality of reproduction. Apart from a slight increase in output in the region of 2,500—3,000 cycles the response in the middle and upper middle registers is in both cases sensibly uniform. The prevailing impression of the quality is one of brightness without too heavy a bass response. Reproduction of speech is exceptionally good. The output transformers have interleaved and impregnated windings and are of more than usually generous design. Tappings are provided for matching to all types of output stages, including Class 'B.'"

A LARGE SELECTION of Phillips surplus components, all in perfect condition. Do not hesitate to send us your order, as owing to the ridiculously low prices we are offering, stocks will be quickly cleared. 1 watt resistances, 400 ohms, 640, 2,000, 8,000, 10,000, 16,000, 20,000, 32,000, 40,000 100,000 and 200,000 ohms, **6d.** each, **5/6** per dozen. Mains transformers, 210–220 volts input, 200-0-200 volts 30 m.a., 4 volt 3 amp., 4 volt 1 amp., **3/6**. Ditto, all C.T. with screened primary, **4/6**. 330-0-330 volts 60 m.a., 4 volts 4 amps., 4 volts 2 amps., **7/6**. Eliminator transformer, output 200-0-200 30 m.a., 4 volts 1 amp., **2/6**. Input, 100-240 volts, 250-0-250 60 m.a., 4 volts 4 amps, 4 volts 1 amp., **5/-**. Smoothing chokes, 1,000 ohm., 40 m.a., 20 henries, **2/-**. 1,200 ohm., tapped at 800, **2/6**. Special high quality choke, as used in Phillips' receivers, nickel iron core, with special high inductance winding 30 henry, **2/9** each, easily fixed, improved results. A large assortment of 100 volt transformers at **1/6** each, stampings alone worth double. Block condensers, 300 volt working, a real high quality job. $0.5\times0.5\times0.5$, **1/6**; $3\times2.5\times1\times0.5\times0.5\times0.1$, **3/6**; $4\times3\times1.5\times0.5\times0.5\times0.2$, **4/6**. All the above represent the finest value of their type in London. Do not be disappointed by sending too late. **DUBILIER** 650 volt test block condensers, $8\times4\times2\times2\times0.25$, **6/-**. 500 volt test, $2\times2\times1\times1\times1\times1$, **4/-**. **POCKET** type 0-15 amp. meters, in polished nickel case, **2/6**. **SWIFT LEVICK** high-grade permanent magnets, for moving coil speakers, weight over 10 lb., 1¼in. pole, gap 60 thousandths, **17/6**. **WATES** polyscope set testers, **6d.**; split anode adapters, **6d.**, worth 1/6 each. **TUMBLER** switches, 10 amp., **6d.** **WATES** 4-valve A.C. chassis, **25/-**, cabinet free with every one. **SUPERIOR** earthing switch, always safe, spark gap and fuse constantly in circuit, enclosed in porcelain case, **1/9**. Zonophone pick-ups, brand new and boxed, **8/6**. **COLLARO** double spring motors, on unit-plate with automatic stop, beautiful condition, complete **17/6**. **VIR** cable, 100-yard coils, 1,044, **4/6**. **TRANSFORMERS** for HT8 and 4 volts 2 amps. C.T., 4 volts 1 amp. C.T. with screened primary for 200-240 volts input, **9/6**. **BRITISH RADIOPHONE**, 3-gang, 0.0005 condensers, ⅛in. spindle, **7/6**. **LARGE DISPOSAL** stock of **KOLSTER BRANDES** loud speakers, in solid oak cabinet, all new and boxed, list number 287, **10/11**, easily worth treble. **PAXOLIN PANELS,** 18×7, **1/-**; 14×7, **9d.** **MARCONI IDEAL** transformers, 2·7–1, 4–1, 6–1, **5/-** each. **MAINS TRANSFORMERS,** input 200-240, output 300 volts 90 m.a., 4 volts 3 amps. C.T., **5/-**. **ERIE 1 WATT** resistors, 350, 4,000, 10,000, 15,000, 20,000, 250,000 ohms, **6d.** each. **KOLSTER BRANDES** Kobra cabinets, ready drilled to take chassis, **10/-**. **PUP** cabinets, **2/6** each. **COLLARO INDUCTION GRAMOPHONE** motors, bronze finish with unit-plate and auto stop, 100-250 volts, boxed and unused **37/6**. **H.M.V. A.C. POWER AMPLIFIERS,** will handle 5 watts undistorted. For 100-250 volts input, components are honestly worth £10 for dismantling. **£3 10s.,** less valves. **ECKERSLEY TROUTON** loud speaker unit complete on chassis with 12in. cone, the most advanced type of balanced armature made, originally listed at 37/6. **7/6** each, all boxed. **LOEWE** vacuum-type resistances, 2 watt, rating 25,000, 50,000 and 100,000 ohms, **1/-** each, **10/6** per dozen. **EDISON BELL** upright type fixed condensers, capacities up to 0.002, **4d.** each, **3/-** per dozen, up to 0.006, **6d.** each, **5/-** per dozen. 0.01, **9d.** each; **7/6** per dozen. **GIVRITE** 1 watt resistors, with wire ends, 1,000, 20,000 ohms, **6d.** each, **5/-** per dozen. **SWIFT LEVICK** high-grade permanent magnets, for moving coils, weight of magnet over 10 lb., diameter of pole 1¼in., gap distance 60 thousandths, **17/6**. **A.C. VOLTMETER.**—Two-range model by high-class manufacturer, 5.5 and 275 volts, boxed, brand new, **12/6**. Centralab twin volume controls, as used in many modern receivers, 10,000 and 20,000 or 10,000 and 100,000 ohms, listed at 12/6 each, our price **2/6**. **PHILLIPS** high-voltage condensers, 0.5 mfd., 6,000 volt working, and 1 mfd. 3,000 volt working, **10/-** each. **ENERGISED** moving coil speaker, for power and pentode, output 2,000 ohm field, **10/6**. **SMOOTHING** chokes, 750 ohm 40 m.a., 20 henry, **3/-**; 1,400 ohm 60 m.a. 30 henry, **4/6**; 640 ohm 30 m.a. 50 henry, **4/-**; shrouded type, 590 ohms 20 m.a. 70 henry, **3/6**. **LOEWE** vacuum-type resistances, with wire ends, 3,000, 10,000, 15,000, 25,000, 50,000, 100,000, 250,000, 1 meg and 0.005 condensers, **3d.** each, **2/-** per dozen. **LOEWE** vacuum-type resistances, with screw ends, 25,000, 50,000 ohms, **4d.** each, **3/-** per dozen. **MARCONI** short wave sets, a real snip, complete in sloping mahogany cabinet, with coils to cover, 16-29 metres, 29-52 metres, **27/6**. **MARCONI** 4-valve battery receiver, **2 S.G. DET** and **POWER,** in sloping mahogany cabinet, at **27/6**. Book yours early, we cannot repeat at this price. **MARCONI** 5-valve A.C. receiver for 200-250 volts, a first-class job, parts alone worth 4 times as much as we are offering the set for, **52/6**, less valves. **COLUMBIA** set cabinets, a real solid job, 15×15×10½, in good condition, **8/6**. **UTILITY** 3-gang 0.0005 condensers, fully screened, complete with disc drive and escutcheon brown knobs, **11/6**. **HIGH-GRADE REISZ** type microphone, in heavy polished aluminium case with suspension rings, **52/6**. Transformer for above **5/6**, stand **12/6** extra. **MARCONI HORN** type speakers, Model 45, all brand new and boxed, **9/6**. **PHILLIPS** 6,000 ohm volume, with mains switch, **3/6**. **SEND US YOUR ORDER WITHOUT DELAY. WE WILL DESPATCH BY RETURN. AT THE ABOVE PRICES YOU CANNOT AFFORD TO HESITATE AS STOCKS WILL BE QUICKLY CLEARED.**

A small valve is an asset in to-day's space-saving wireless sets. The OSRAM "CATKIN" VALVE is a small valve with a stout heart. It is conceived and built to give a higher standard of performance. Highest uniformity is made possible by metal construction. A 'picked' valve becomes a thing of the past—*every* OSRAM "CATKIN" VALVE is made with absolute accuracy and uniformity of characteristics.

EDITORIAL COMMENT

Car Radio

The Rumours of Official Restrictions

INTEREST in car radio is undoubtedly increasing in this country and it looks as if, in the course of the next few months, a large number of sets will be fitted both on new models of cars and existing types. All sorts of rumours have been current as to what may be the official attitude towards car radio, and it has been suggested that the Ministry of Transport or the Home Secretary will prohibit the use of wireless whilst cars are travelling on the road.

It is not unnatural that some alarm should be felt by those wireless manufacturers who are at present interesting themselves in the development of car radio at the idea of restrictions of this kind, because the public are not likely to spend money if there is any likelihood of a ban being put on the use of the sets at an early date.

Wireless on motor cars is not by any means a new idea; portable sets have been carried for years past, and sets built in as permanent fittings on a car have also been known in this country almost since the days that broadcasting started. It is only recently, however, that the possibilities of a really compact and efficient set have made the idea generally attractive for privately owned cars.

The officials of the Ministry of Transport and the Home Office have, naturally, had to look into the question of car radio from the point of view of accident risks on the road, and consider whether special regulations ought to be issued governing the use of car wireless. Consultations have certainly taken place, but, as yet, no statement has been made by these authorities as to what their attitude will be. On the face of it, the possibility of a prohibition of wireless on cars seems impossible. It is at present not illegal to carry and use wireless on a car, and the only action that the police might take would be on the grounds that, because the driver's attention was distracted by wireless, the car was being driven negligently or dangerously. We hope that if the Home Office and the Ministry of Transport have any recommendations to put forward, or if they contemplate regulations affecting the use of wireless on cars, they will lose no time in making these known. It would be unfortunate if car radio were developed on lines which subsequently had to be revised because of new regulations.

Regulations, if any, should be with the object of ensuring simple control of the set so as to cause the least possible distraction from the attention of the driver. For this reason it seems particularly desirable that tuning should be by touch rather than visual in order to avoid any necessity for the driver to take his eye off the road in order to adjust the set.

End of Summer Time

Prepare for Winter Reception

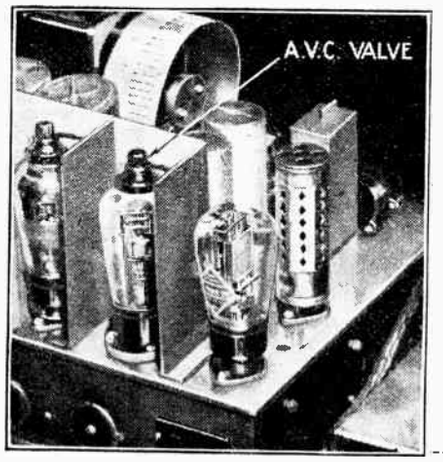
SUMMER TIME ends in the first week of October and the change will revive intense interest in foreign station reception. Let us make the most of our opportunity now during fine weather to overhaul aerials and earths and put up the best outside aerial which space will permit. With automatic volume control there are now dozens of foreign stations which can be received as well and consistently as many locals. A good aerial will make the average set a super set from the point of view of distant reception.

Delayed Amplified A.V.C.

Designing the System—Some Practical Considerations

By W. T. COCKING

A SIMPLE method of selecting the correct delay voltage for a delayed diode automatic volume control circuit was recently described[1] and it is intended in the present article to extend the treatment to cover the case of delayed amplified A.V.C., for this is a system which better fits the average receiver in which a moderate degree of H.F. amplification and a fairly large amount of L.F. amplification are employed. With amplified A.V.C., the bias voltages developed by the detector are amplified before being applied to the H.F. valves, and this results in the detector being operated at a smaller input than in the simpler case.



A duo-diode-triode provides amplified A.V.C. in the R.G.D. Superheterodyne.

The first step in design is to calculate the delay voltage required, and as before, we shall assume that two H.F. stages with Mullard V.P.4 variable-mu H.F. pentodes are used, and that for a signal input varying in the ratio of 5,000-1 the L.F. output must not change by more than 2-1, or 6 DB. The input ratio is equivalent to a change of 74 DB, so that the amplification of the H.F. stages must change by 74 – 6 = 68 DB between a weak and a strong signal. The bias voltage change on the H.F. valves for this can be read off from the curve B of Fig. 2, which is repeated from the previous article. Curve A of this figure shows the variation of amplification, with bias voltage for a single H.F. stage, and curve B for two such stages.

The Action of the Circuit

We see immediately that if the initial bias of 1·5 volts remains constant we require 16 volts A.V.C. bias for a strong signal, but that if the initial bias drops with increasing A.V.C. bias, as with cathode type biasing, we require nearly 17·5 volts. In the previous article we assumed that the initial bias was maintained, as when it is derived from a potentiometer across the H.T. supply; this time let us assume that cathode biasing is used, and we shall then need 17·5 volts A.V.C. bias for a strong signal.

Fig. 1 shows the fundamental circuit of the amplified A.V.C. system using transformer coupling to the succeeding valve.

[1] *The Wireless World*, Sept. 8th, 1933.

A duo-diode-triode type valve is used to provide signal rectification, delayed amplified A.V.C., and the first stage of L.F. amplification. Signal rectification occurs in the diode circuit A1, and the D.C. potential consequent upon rectification is developed across the load resistance R1; the L.F. voltages also appear across this resistance, and these are applied to the grid of the triode portion of the valve through the condenser C1, the resistance R1 acting as a manual volume control. The full D.C. potential across R1, however, is applied to the grid through the resistance R2.

In the absence of a signal, the grid of the triode assumes a potential which is about 0·7 volt negative with respect to the cathode in the case of the MHD4 valve, owing to the triode grid current flow, and the steady anode current of the triode is then determined by the value of the resistances R3 and R4 and by the H.T. voltage applied. Normally the circuit values are selected so that with no signal the cathode is positive with respect to the earth line by the amount of the delay voltage required. The grids of the controlled valves are returned to earth through the filter resistance R6 and the delay-diode load resistance R5, which normally has a value of some 0.5 meg. Since the cathode is positive with respect to the earth line, and the diode anode A2 is returned to the earth line through R5, the anode A2 is negative with respect to the cathode, and there is no current flow. The bias on the H.F. valves is then only that provided by their own individual biasing resistances.

AMPLIFIED A.V.C. has the advantage over simpler forms in that it operates with a modest detector input and so throws less strain on the H.F. amplifier. In this article, the design of amplified A.V.C. circuits is considered in a practical manner.

The Delay Operation

When a signal is applied to the diode A1, rectification occurs, and the diode anode, and consequently the triode grid both assume a potential negative with respect to the cathode, and of a value which is dependent upon the signal strength. As a result, the anode current of the triode falls, and the voltage drop across R4 is reduced. The cathode, therefore, becomes less positive with respect to the earth line. In the diode A2 circuit nothing happens until the cathode becomes negative with respect to the earth line; when the signal is strong enough for this to occur the anode A2 becomes positive with respect to the cathode, and this diode becomes conductive. Since the internal resistance of the diode is low compared with R5, the internal voltage drop can be ignored, and the diode anode assumes practically the same D.C. potential as the cathode. As the cathode moves increasingly negative with respect to the earth line with increasing signal strength, therefore, so the potential of the diode anode A2 and the A.V.C. line follow it.

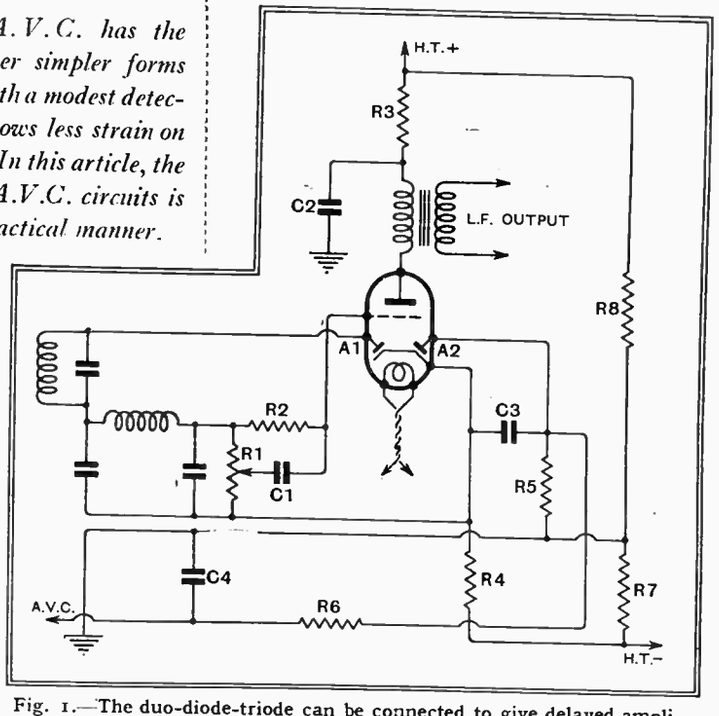


Fig. 1.—The duo-diode-triode can be connected to give delayed amplified A.V.C. The anode A2 is negatively biased in the absence of a signal and is non-conductive. With a strong signal the anode-cathode path becomes conductive and the anode assumes practically the same potential as the cathode.

To return to the design problem, it will

Delayed Amplified A.V.C.—be seen that our first problem is to assign circuit values such that with no applied signal the cathode potential is positive with respect to the earth line by the delay voltage required, in this case 17.5 volts. Let us assume that we have a total H.T. supply of 270 volts, and that we need a total of 200 volts for the H.F. stages. The drop across R8 will be 200 volts (in practice this resistance may be replaced by the other valves in the set) and that across R7 will be 70 volts. The cathodes of the

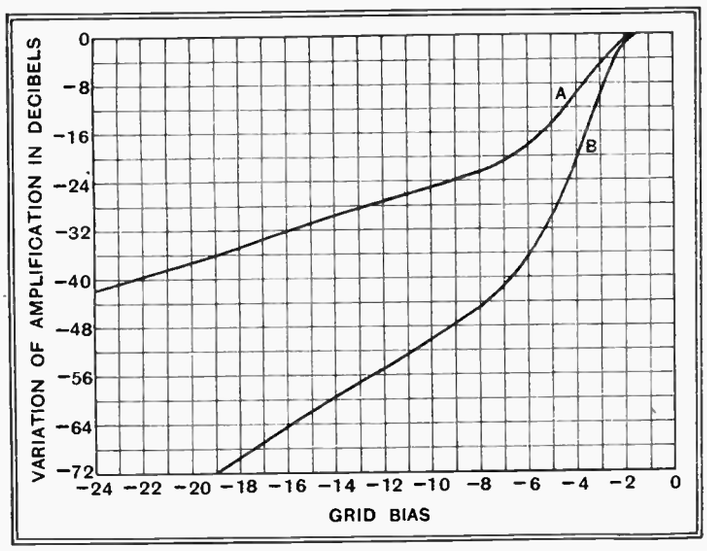

Fig. 2.—The variation of amplification with bias for one (A) and two (B) H.F. stages is shown here.

controlled valves are returned to the earth line, so that the initial cathode potential of the duo-diode-triode must be 70 + 17.5 = 87.5 volts positive with respect to negative H.T. The drop across R4, therefore, must be 87.5 volts.

Calculating Circuit Constants

The problem of selecting the value of R4 is complicated by the presence of the decoupling resistance R3, but as this will usually be necessary we cannot afford to neglect it. Let us assume that we shall lose 50 volts across R3 with no signal. The voltage available across the valve and the cathode resistance R4 will then be the total H.T. voltage less the drop in R3 or 270 − 50 = 220 volts. Fig. 3 shows the anode volts-anode current curves for the triode portion of the MHD4, and from this we can immediately derive the values of R4 and R3. We have a total of 220 volts across the valve and R4, and we know that the drop across R4 must be 87.5 volts, so that the difference, or 132.5 volts, must be the actual anode voltage of the valve. With no-signal, the triode grid potential will be about −0.7 volt, so that we can immediately read off the no-signal anode current of the valve, and this is equal to 4.8 mA.

We have, therefore, to drop 87.5 volts at 4.8 mA. in R4, which must thus have a value of 18,250 ohms, and 50 volts at the same current in R3, which must be 10,400 ohms. It should be noted that we have assumed that the L.F. transformer primary has zero D.C. resistance, which is untrue. The actual value used for R3, therefore, should be the calculated figure less the resistance of the transformer primary. One well-known transformer has a primary resistance of 2,400 ohms, and in this case the actual value of R3 would become 8,000 ohms.

The next step is to draw a load line on the valve curves with a slope corresponding to the total anode and cathode resistance, and from the full H.T. point of 270 volts. The total resistance is 28,650 ohms, and is represented by the line AB of Fig. 3. This permits the anode current of the valve for any grid potential to be read off, and by multiplying the current by the cathode resistance R4 we can obtain the voltage drop across this for any grid potential. This is shown by the curve of Fig. 4, and represents the cathode potential with respect to negative H.T. We are interested, however, in the cathode potential only during that time when it is negative with respect to the earth line, for this represents the A.V.C. bias. The figures in question can be obtained from Fig. 4 by deducting the potentials less than 70 volts (the difference between the earth and negative H.T. lines) from 70 and ignoring the potentials greater than 70, for the diode A2 is then non-conductive. We thus obtain the curve of Fig. 5.

Now for the strongest signal we need a bias of 17.5 volts, and Fig. 5 shows the grid potential necessary to give this bias, and it will be seen to be 2.95 volts, or, say, 3 volts. With this bias there will be no grid current flow in the triode, so the diode A1 must provide 3 volts bias as a consequence of rectification. Curves for

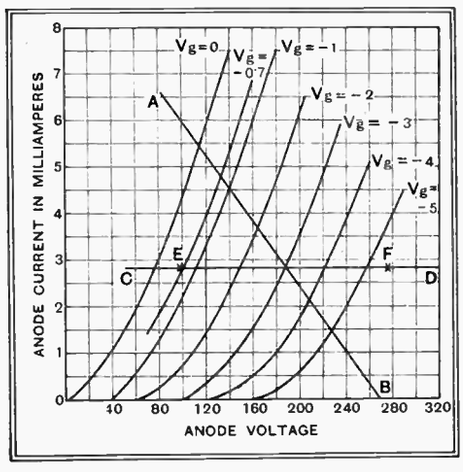

Fig. 3.—Anode-volts—anode-current curves of the MHD4 duo-diode-triode used in determining the operating conditions.

the rectification efficiency of a diode show that this D.C. potential is developed when the H.F. input is about 3 volts R.M.S., or 4.2 volts peak.

It is immediately obvious that no type of variable-mu valve at any high bias would give distortion on such a small output, even when the peak value is 7.56 volts as with deep modulation. Even with a band-pass coupling preceding the detector, the output of the last H.F. or I.F. valve will only be about 15-16 volts peak, and this should raise little difficulty. The stage immediately preceding the detector can thus be fully controlled.

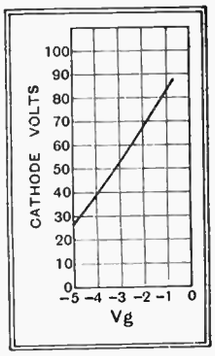

Fig. 4.—The variation in cathode potential for various grid bias voltages is shown here.

The L.F. voltage developed across the diode load R1 for 80 per cent. modulation will be 3 × 0.8 = 2.4 volts peak, so that at maximum input the L.F. grid voltage of the triode will swing between −0.6 volt and −5.4 volts if the manual volume control be set at maximum. The load impedance to L.F. currents is not the D.C. resistance of the circuit, but the transformer primary impedance, and on the curves of Fig. 3 this can be represented by a horizontal straight line drawn through the intersection of the −3 volts curve with the D.C. load line. This is shown by the line CD, the points E and F representing the limits of the L.F. grid swing. These points are nearly equidistant from the −3 volts line, so that amplification will be practically distortionless.

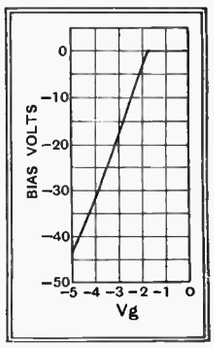

Fig. 5.—This curve shows the A.V.C. bias voltage available for various grid voltages on the MHD4

The L.F. amplification obtained will be equal to the valve amplification factor, and at the working point this is about 34. The L.F. output on the transformer primary for maximum signal, therefore, will be 34 × 2.4 = 81.6 volts peak with 80 per cent. modulation. With minimum signal, of course, at which A.V.C. just commences to operate, the output will be one-half, or 40.8 volts. With a transformer having a ratio of 3.5-1, therefore, an output stage capable of handling an input of 142.5 volts can be fully loaded.

In the majority of cases, of course, the output stage requires a much smaller input, so that the manual volume control would normally be turned down to give a smaller proportion of the available L.F. potential on the triode grid. This means, of course, that the L.F. amplification is

Delayed Amplified A.V.C.—

really excessive, but it can be turned to good account when it is desired to receive really weak signals which do not provide sufficient output at the normal setting of the control.

Now, in the previous article describing delayed diode A.V.C., it was assumed that the maximum input to the first H.F. valve would be 5 volts R.M.S. and the minimum 1 millivolt, and it was shown that the stage gain required from each H.F. valve to fulfil the conditions led to a figure difficult to attain in practice owing to instability troubles. Let us, therefore, calculate the gain required in this case for the same input figures. The detector input for A.V.C. threshold is 1.5 volts R.M.S., and the first H.F. valve input 1 millivolt, so that the amplification must be 1,500 times, or 38.7 times per stage. This is a very reasonable figure, and quite in accordance with modern practice for two H.F. stages.

It will thus be seen that amplified A.V.C. offers considerable advantages over the simpler diode circuit, for the D.C. amplification of the bias potentials which is obtained reduces the amount of H.F. amplification necessary for good automatic volume control. Its sole disadvantages are the greater circuit complication and the need for providing a steady potential which is negative with respect to the earth line.

The Choice of Circuit

Although it has been shown that amplified A.V.C. is superior to diode A.V.C. for the particular case which we have considered, it must not be thought that it is always so. The type of receiver taken as an example is a common one, and, therefore, it is true to say that amplified A.V.C. is usually better than the simpler diode controls. Much depends on the total pre-detector amplification, however, and in the case of a superheterodyne, where three stages can often be controlled, amplified A.V.C. may indeed prove disadvantageous and the difficulties of the delayed diode control are reduced. Moreover, in these two articles neither delayed diode A.V.C. with L.F. control nor delayed square law A.V.C. has been considered. The whole question as to the choice of an A.V.C. circuit may be summed up by saying that no one method is generally the best, and the best system for any particular receiver will depend upon the design of that set.

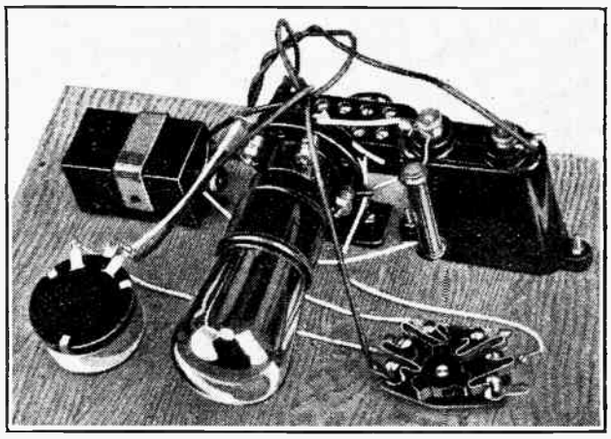

Fig. 6.—*The Wireless World* A.V.C. Unit is an example of one form of amplified automatic volume control.

DISTANT RECEPTION NOTES

More Power Increases on the Continent

PLANS for increasing the power of the Paris PTT station from 7 kilowatts to 120 have recently been approved. The new transmitter is to be situated at Villejuste, twelve miles outside the city, though the studios will remain in Paris itself. Under the Lucerne Plan the wavelength of the station will be 431.7 metres, and it will have Belgrade on one side and Stockholm on the other as next door neighbours.

Extensive alterations will be required at the Muhlacker station of Stuttgart to increase the output power to 100 kilowatts and the wavelength to 522.6 metres. For this reason the station is now silent until 4 p.m., and it will be closed down entirely from the middle of October until the beginning of December, the old 1.5 kilowatt transmitter taking on the service.

A correspondent writes to ask why I so frequently mention Katowice as a good station since in his area "it has not been worth two minutes' attention since the winter before last." Curiously enough he lives not more than thirty miles from me, and I find Katowice one of the strongest and most reliable of Continental stations from about 8 p.m. onwards. His trouble, I think, is that lack of selectivity prevents him from separating Katowice from Athlone and Söttens.

American Stations

In a recent note I suggested that we ought soon to be hearing more of American stations with wavelengths above 300 metres. Up to the end of last month very few transatlantic stations with wavelengths higher than this were at all well heard, though several of them could be received rather feebly. I can now report excellent reception of WGY on 379.5 metres and WJZ on 394.5 metres.

A correspondent tells me that he received an American station recently at very great strength on 348.6 metres. This is WABC, the 50-kilowatt station of the Columbia broadcasting chain situated in New York City.

Is Berlin Witzleben's new transmitter now in use from about 10.30 p.m. onwards? I find the station quite weak, if indeed it is audible at all, during the early part of the evening; but later on it comes in with fine strength. Any reader who has not recently received Witzleben should certainly try for it now.

Recommended Transmissions

There is intermittent interference still with Huizen from a Russian station, though I have not often found it troublesome of late.

The long-wave stations are all in good form. Oslo in particular is showing remarkable strength.

The stations at the top of the medium waveband have now definitely returned to good strength, good reception being obtainable from Budapest, Munich and Vienna. On one recent evening, however, Vienna had a strong background which appeared to come from Riga. If so, the Latvian station must be working rather below its normal wavelength. Florence is still heterodyned on many evenings, and Turin suffers badly in the same way.

Beromünster, Prague, Rome, Toulouse, Strasbourg, Breslau, Hilversum, Heilsberg, and Trieste are outstanding medium-wave stations, though there are many others from which first-rate reception is regularly obtainable.

FOREIGN BROADCAST GUIDE

BUCHAREST

(Roumania).

Geographical position: 44° 25′ N.; 26° 2′ E.

Approximate air line from London: 1,300 miles.

Wavelength: 394.2 m. Frequency: 761 kc/s. Power*: 12 kW.

Standard time: Eastern European (G.M.T. *plus* 2 hours) (Roumania adopts Summer Time.)

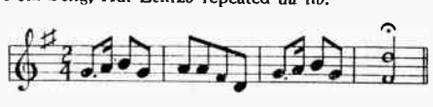
Standard Daily Transmissions.

10.00 B.S.T., Sacred service (Sun.); 13.00, gramophone records, news; 17.00, concert, news, weather; 20.00, main evening entertainment; 22.15, dance music, news, weather.

Announcer: Woman.

Call: (Phon.) *Attent-see-oon-aye ah-eetch-ee rah-dee-owe Book-oo-recht-ee.* Announcements are all made in the Roumanian language, but occasionally also in French, German and Italian.

Interval signal: The following bars of a Roumanian Folk Song, *Hai Lelitzo* repeated *ad lib.*



Closes down with good-night greetings (in Roumanian), *Buna seara tuturor*, repeated in different languages and followed by *Traiasca Regele* (National Anthem) played on a gramophone record.

* *A high-power transmitter is under construction.*

HINTS AND TIPS BOOKLET

With the issue of October 6th, a special supplement will be included in the form of a 32-page Booklet of practical *Hints and Tips*, specially compiled by the staff of THE WIRELESS WORLD.

UNBIASED

By FREE GRID

Still continued to mow.

A Snake in the Grass

RECENTLY, when I happened to be staying at the home of a rather unpleasant sister-in-law, I was rudely awakened one afternoon, while taking a siesta in the garden, by a demand to "come and see what's wrong with the wireless." With many muttered imprecations I bestirred myself and went into the house, where I found that electrical interference of a particularly objectionable type was drowning everything.

All my efforts to stop the trouble failed, and after spending many days experimenting with various forms of interference suppressors and a goodly portion of my sister-in-law's money in purchasing the necessary gear, I dropped everything and took to detective work. After a fruitless search of the neighbourhood I had almost given the job up as hopeless when I observed that the trouble seemed to coincide with the mechanical rattle of a mowing machine a few gardens away. Naturally I immediately suspected radiation from the ignition system of a motor mower, and I hastily went upstairs to make closer observation from a bedroom window.

To my surprise nothing was in view save a perspiring little man pushing a heavy-looking mower of a more or less conventional type under the direction of an imperious-looking female of amazonian proportions. I was about to turn away when the servile little serf took advantage of a momentary disappearance of his chain-gang overseer to stop and mop his brow. To my utter amazement the mower, though standing still, continued to mow. Hastily calling for a telescope I took a further observation, and noticed a snake in the grass in the form of a cable running from the machine to the house.

I immediately consulted a large firm of mowing machine makers on the 'phone concerning this strange phenomenon, and was told that this was a new type of machine which was rapidly becoming universal; only the knives were driven by the electric motor. The older type, in which the whole machine was electrically driven, had been superseded, because members of the so-called fair sex had been in the habit of forgetting to switch off when stopping to chat with a neighbour over the fence, with the result that the machine had run amok, lopping off flowers, bushes, babies, dogs, and other impedimenta in its mad career.

My New Down Lead

IN spite of all the progress that has been made in radio, we are still faced with the incongruous sight of a set housed in a beautiful piece of cabinet work connected up to the aerial by a straggling wire which meanders through the house till it finally connects with the down lead. The reason for this state of affairs is that the average urban and suburban house has its garden, and, therefore, its aerial, at the back, whereas the listeners themselves, with that peculiar cussedness which endears them so much to the hearts of the B.B.C. programme staff, insist on sticking their receivers in a room in the front of the house.

It is true that there are plenty of patented indoor aerials on the market, but no matter how sensitive the set is, a lofty outdoor aerial is always to be preferred on account of the improved signal-strength-to-noise ratio which it gives. The same argument holds good against a set which employs a frame aerial or a "mains" aerial.

I flatter myself that I have solved the problem in a manner which greatly redounds to my credit. The arrangement I have fixed up is really very simple. All that I have done is to fix a length of screened aerial down lead under the floorboards so that one end terminates at a

A straggling wire.

wall plug, the other end, of course, carrying on outside the house until it gives place to the ordinary down lead.

I find that the losses due to this arrangement are extraordinarily small, and, of course, the lead coming from the wall plug to the set is no more conspicuous than the mains lead running from the neighbouring wall plug. As for my earth lead, this is plaited in with the mains flex, and, since I naturally use a three-point plug and socket, all difficulties of connection are completely overcome.

I find that there are very little losses even if I plait the aerial lead with the others; and so I am now waiting for an enterprising manufacturer to produce a four-point plug and socket for use in order to make the job a really neat one. Judging from my knowledge of manufacturers, however, I fear that I shall have to wait for a confoundedly long time.

Can One Steal Electrons?

I NOTICE that quite a large number of people have been prosecuted lately for stealing electrical energy from the wires of radio relay companies. In my opinion none of the defendants are deserving of any sympathy save one good lady who, according to a newspaper report, has parted with the sum of £1 for "fraudulently extracting a quantity of electricity."

Carefully put back by her.

If the good dame will take a spot of advice from me she will appeal and, if need be, carry the case right up to the House of Lords. It may certainly have been wrong to tap the wires of the relay company and steal entertainment therefrom, but that was not the subject of the charge. I entirely fail to see how anybody can "extract" a quantity of electricity from the relay company's wires, and she could, I think, successfully plead that the electrons which she took out were carefully put back by her, as they merely flowed out of one wire, trotted round her loud-speaker windings, and then went back to the company by the other wire. If the lady cares to take action she is assured of my full moral support.

The Electrostatic Loud Speaker

II. Matching Loud Speaker and Output Valve

By M. G. SCROGGIE, B.Sc., A.M.I.E.E.

THE electrostatic loud speaker is unique in presenting a capacitative load to the output valve, and the conditions necessary to prevent distortion and overloading are essentially different from those of moving-iron or moving-coil types.

WE have seen the fundamental difference between the electrostatic loud speaker and all other types. Before it can be effectively used it is necessary to consider it as a load in a valve circuit.

A moving-iron speaker can be considered approximately as an inductance. A moving-coil speaker is conveniently (but not very accurately) assumed to be a resistance. An electrostatic speaker may be represented as a capacity, perhaps not quite so pure (i.e., free from resistance) as the very best condensers, but one does not go far wrong in neglecting the impurity.

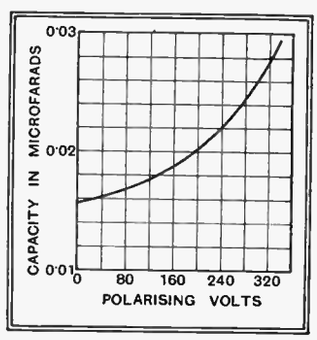


Fig. 1.—Variation of capacity with polarising voltage in the "Primustatic" 18in. × 20in. loud speaker.

It has already been explained that the effect of a voltage between the two plates is to draw them closer together. Therefore, one would expect the capacity to be increased thereby, and this is exactly what happens. Fig. 1 shows the measured capacity of a "Primustatic" loud speaker with an 18in. by 20in. diaphragm. The capacity averages about 0.008 mfd. per square foot, or a reactance of about 20 megohms divided by the frequency in cycles per second.

The Load Diagram

In drawing load curves on a valve diagram the loud speaker is usually represented by a straight line, which means a resistance, constant at all frequencies. No loud speaker ever does act just like that, but a moving-coil type is near enough to it over the middle range of frequencies for one to get at least a hazy idea of how to match it to the valve. Our condenser speaker has this advantage at least, that it is very closely a capacity load, but, unfortunately, it is therefore not a straight line at all, but an ellipse, and one of a different size at every frequency. So it is rather an exasperating business trying to fit it comfortably into the valve diagram. To start with, it would be worse than manufacturing a "Mickey Mouse" film to draw a diagram for *every* frequency, so let us select three only—80, 800, and 8,000. The respective reactances of a $2\frac{1}{2}$ square foot speaker are 100,000, 10,000, and 1,000 ohms.

There are two ways in which these figures can be altered to suit the valve: first, by selecting a diaphragm of different area, and, secondly, by using a step-up or step-down transformer, which has the effect, looked at from the *primary* side, of multiplying the reactance by the square of the transformer ratio. A step-up is equivalent to an *increase* in capacity. But it is inevitable that with any one arrangement the reactance must vary over the same range as the frequency.

The result of this characteristic is that the behaviour is strikingly different according to whether a triode or a pentode is used. Fig. 2 shows a diagram for a triode with an internal resistance (impedance) of about 2,500 ohms, and the three reactance eclipses have been drawn in to show what happens at the lowest, middle, and highest frequencies. The ellipses in each case are the largest that can go in without running into grid current on the left, or bottom-bend rectification at the foot.

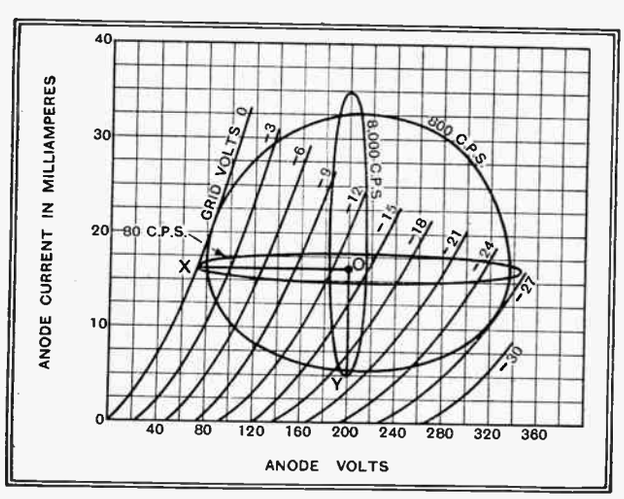

Fig. 2.—The load ellipse of an electrostatic loud speaker varies in shape and inclination as the frequency changes.

At 80 cycles the full grid excitation is possible; that is to say, the grid voltage can be swung right from zero on one side to double the bias voltage on the other, without any possible risk of overloading due to rectification. The voltage developed across the loud speaker is the maximum possible.

Permissible Grid Volts

At 800 cycles it is just possible to give it the full grid, but the ellipse has opened out so much that it is approaching the danger zone along the foot. Still, it is working quite happily and developing practically the full voltage. At any higher frequency, however, the lower half would be flattened out, unless the whole ellipse were reduced in size by reducing the grid input. This is well shown at the upper extreme of 8,000 cycles, where the grid excitation must be reduced to less than a half in order to avoid rectification distortion, and the anode voltage developed across the loud speaker dwindles to about a tenth.

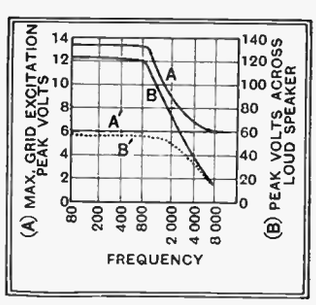

Fig. 3. — Curves showing maximum permissible grid volts with capacity load.

These features are illustrated rather more concisely in Fig. 3. Curve A shows the maximum peak volts that can be applied to the grid without overloading, and curve B shows the voltage developed across the loud speaker with maximum grid volts as given. In each case the voltage is level up to a certain critical frequency, in this case 800 cycles, after which it rapidly falls. It must not be hastily concluded that the response suddenly falls off above 800 cycles, for it must be emphasised that curve B is strictly dependent on A, and shows the maximum output short of overloading the valve.

P. P. Eckersley has shown experimentally that in normal broadcasting the amplitudes to be expected at the upper frequencies are considerably lower, and would come well below curve A. In addition, by-pass condensers, H.F. tuning characteristics, and other factors are almost certain to prevent the grid voltage from breaking the allotted bounds. So if the grid excitation is kept at a level six volts throughout, as it can be without fear of overloading (curve A′), the output is as shown by B′.

Another point is that it is the falling part of curve B′, rather than the level part, that is correct. The amplitude of diaphragm required to give a constant

The Electrostatic Loud Speaker—

output of sound gets steadily less as the frequency rises. It is not possible to state exactly what is the ideal characteristic without knowing exactly how the particular type of diaphragm behaves at various frequencies; but a listening test with a constant-amplitude pure tone shows a satisfactory response down to about 800 cycles, and a falling response below that.

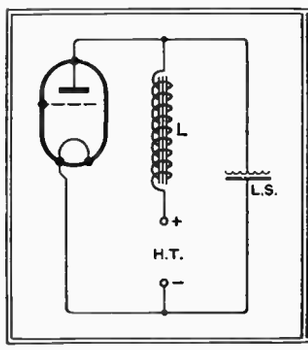

Fig 4.—Choke coupling provides the simplest connection between valve and loud speaker.

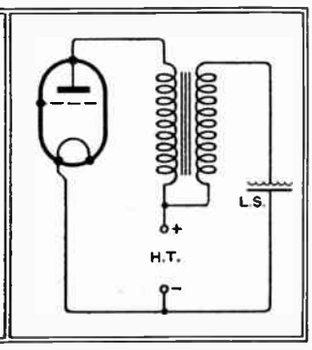

Fig. 5.—Connections for applying polarising voltage with transformer coupling.

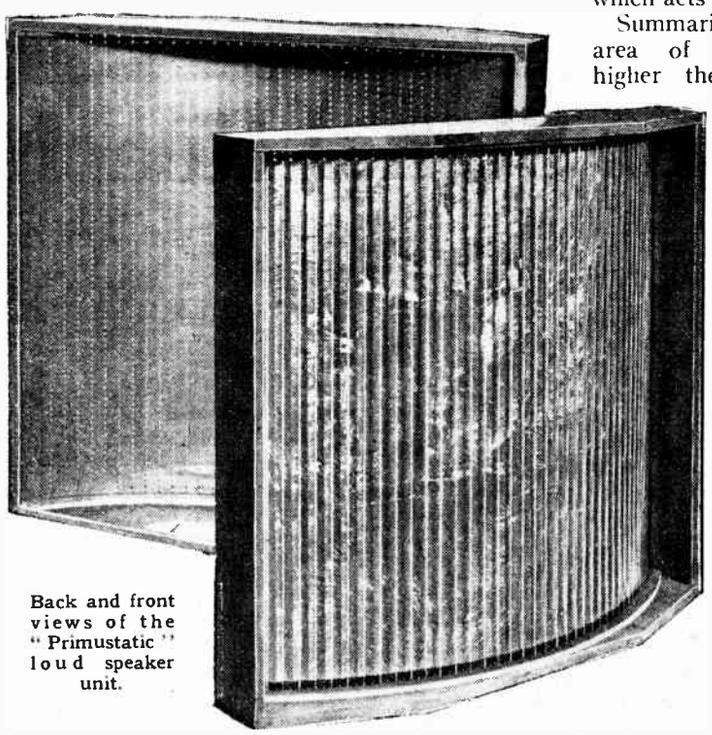
The Critical Frequency

We can calculate this critical frequency by measuring the distance in anode volts horizontally from the initial working point O on the valve diagram to the zero grid voltage point X, and dividing this by the vertical distance, in anode milliamps, from O to Y, the minimum current consistent with avoiding severe curvature. This gives the reactance in thousands of ohms, which is also equal to $\frac{1,000}{2\pi fC}$, where f is the frequency and C is the capacity in microfarads; so it is easy, knowing C, to calculate f. By altering C in either of the two ways already described it is possible to shift the critical frequency f, thus extending either the level or the falling part of the curve.

As it has just been stated that it is the falling part that is correct, it would seem that the sensible thing to do would be to make the critical frequency as low as possible. That means making either the actual capacity or the step-up ratio as large as possible. An additional allurement is that an increase in capacity means an increase in sound-radiating surface, and an increase in step-up means an increase in signal voltage, and in either case it looks as if the volume would be increased without any greater expenditure of power. But, while it is true that there is improved *uniformity* of response, the improved *efficiency* fails to materialise; for curve A is shifted to the left too, and necessitates severely cutting down the input. And, as the lower tones are less audible than the upper, there is an apparent falling-off in volume, and in endeavouring to restore it by the volume control the only result is rattling and distortion. If, on the other hand, the capacity is too small, the volume again drops, and what output there is consists almost entirely of extreme top.

Hence a compromise is necessary, giving a reasonable efficiency at the upper frequencies, the lower being augmented, if necessary, by a bass moving coil unit.

To descend for a moment from these theoretical reasonings to consider how the connection is made in practice, the simplest circuit is that of Fig. 4, where L is a choke of high inductance capable of carrying the valve anode current. In this way the loud speaker receives both the output voltage from the valve and the steady polarising voltage from the H.T. source. The choke behaves as a 1 : 1 transformer, and if its inductance is sufficiently high it by-passes a negligible proportion of the "signal," and so the whole arrangement conforms very closely to the preceding theory. It may be of interest to realise that at one particular frequency the impedance of the anode load is almost infinite, due to the resonance of choke and loud speaker, and is also a pure resistance, and hence a nearly horizontal straight line instead of an ellipse. With normal components this frequency is about two or three hundred cycles, but the phenomenon does not appreciably modify the performance as already described. The whole action is very beautifully confirmed by cathode ray oscillograph tests, using a variable-frequency oscillator. Beginning at the lowest frequencies, we see the "lengthwise" ellipse become a straight line, and then open out into an "upright" ellipse, which, unless the input is reduced, causes terrible overloading, the anode current rising much above normal.



Back and front views of the "Primustatic" loud speaker unit.

If a transformer is used to alter the ratio it is essential to allow for the polarising voltage (Fig. 5), and if it is a step-up ratio it may be desirable to add some auxiliary voltage, but only if the H.T. voltage itself is rather low. An old dry battery can be used, as no current is drawn. If the secondary is linked to the anode end of the primary the sum or difference of the voltages across both windings is obtained, giving a choice of three ratios altogether.

Push-pull Connections

A push-pull stage is much to be recommended, and Fig. 6 shows one method of connection. If there is no secondary winding, or if it is being used for another loud speaker, the connection of Fig. 7 is another of the many schemes. Although this looks a one-sided arrangement, it actually loads the whole transformer, which acts as a 2 : 1 step-down.

Summarising: the larger the area of diaphragm, or the higher the step-up, the lower is the frequency below which response falls off. But the lower also is the efficiency and the greater the tendency to rattle. So only when there is plenty of power available in the last stage is it possible to arrange these matters so as to go low down the scale. The smaller the number of milliwatts available the higher must be the critical frequency. A dual speaker combination is in any case the best for effective reproduction over the whole audible scale. Methods of obtaining this, together with tone control, and the conditions for pentode operation, will next be considered.

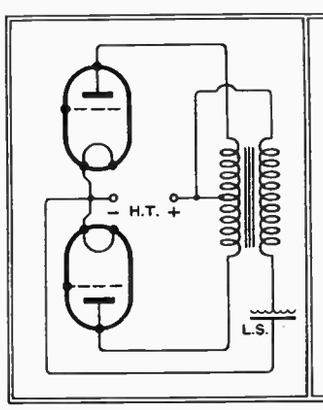


Fig. 6.—Push-pull output using transformer secondary winding to energise the loud speaker.

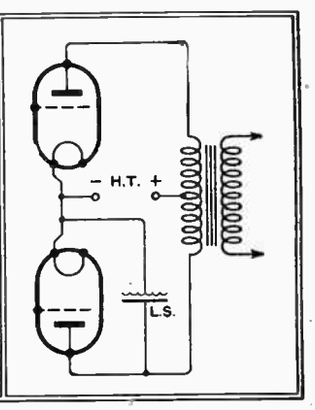

Fig. 7.—This circuit gives a 2 : 1 step-down and leaves secondary free for an additional loud speaker.

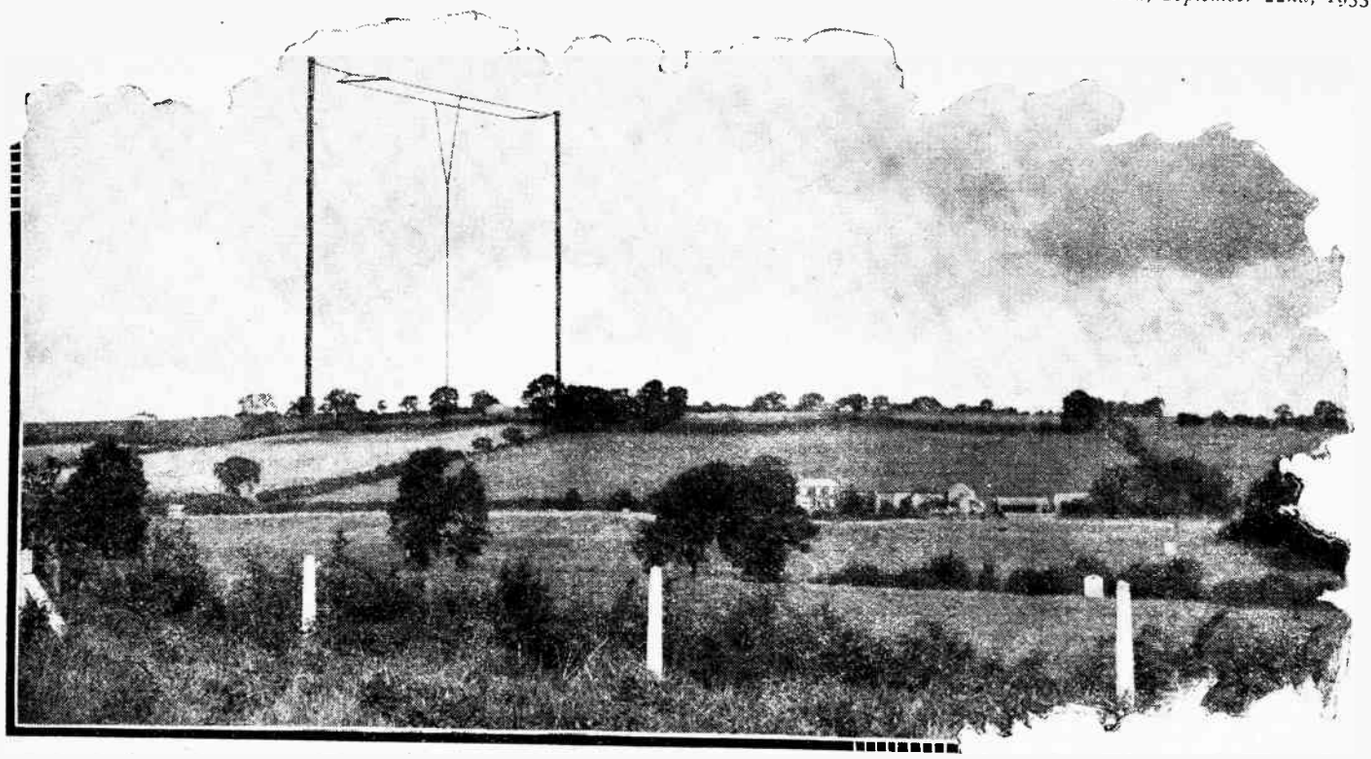

How the Signal Reaches Your Set

Modulation and the Purpose of the Carrier Wave Explained

By S. O. PEARSON, B.Sc., A.M.I.E.E.

THE most vital principle of wireless communication is that of modulation of the carrier wave. The purpose of the carrier wave is often not properly understood, yet no real conception of what happens in a receiver can be gained without a grasp of this fundamental principle.

AS one listens to an item in a broadcast programme one can readily appreciate that the sound waves emanating from the diaphragm of the loud speaker must bear a very close resemblance in form to those actuating the microphone at the broadcasting station. If this were not so the sounds received would be unpleasantly distorted, if not unintelligible, for the smaller the degree of wave-shape distortion in the sending and receiving systems the more realistic and true to life is the reproduction.

The air vibrations, or waves of rarefaction and compression representing sound, extend over a considerable range of frequencies. The upper and lower limits of this range, however, are not very sharply defined, depending to a very large extent on the intensity of the sound and to some extent on the individual listener. In general, audible frequencies may be considered to extend from about 16 cycles per second at the lower end of the scale to perhaps 10,000 cycles per second or more for the highest notes. In the case of orchestral music practically the whole of this range of frequencies is involved, the highest frequencies representing the overtones of violins, etc. Ordinary speech involves a frequency range from about 100 cycles per second to 5,000 cycles per second or so. Intelligible speech can be transmitted on a much narrower band of frequencies, but when this is done the speaker loses the essential characteristics of his voice, which convey to some extent an impression of his personality. So to obtain realistic reproduction at the receiver all frequencies must be delivered by the loud speaker in their correct relative amplitudes.

Need for the Carrier Wave.

At the transmitting station the microphone converts the sound waves impinging on its diaphragm into electrical variations of the same wave form, and consequently these electrical variations are represented by frequencies which all lie within the audible range. These frequencies are usually referred to as "low frequencies" or "audio-frequencies," to distinguish them from the very much higher frequency of the oscillations in the aerial system. The necessity for high-frequency oscillations will now be briefly explained.

A little thought will make it quite clear that the audible frequencies cannot be directly transmitted through the ether because, for one reason, every station would have to operate over the same range of frequencies and selection would be impossible; the transmitting station must send out from its aerial system a train of ether waves of *fixed* frequency in order that distant receivers may be accurately tuned to it. And, further, the frequency must have a very high value compared with the frequencies within the audible range, the main reason for this being that the efficiency of an aerial as a radiator of energy falls off very rapidly as the frequency is lowered. The efficiency of radiation is proportional to the square of the frequency. The lowest frequency used for ordinary broadcasting purposes is about 155,000 cycles per second, corresponding to 1,935 metres wavelength; and the shortest wavelength stations operate with a frequency in the neighbourhood of twenty million cycles per second!

The constant-frequency waves emanating from the transmitting aerial are made to serve as the means of conveying the low-frequency or speech-frequency variations, representing the matter to be broadcast, from the transmitting station to the various receiving aerials. For this reason the train of high-frequency waves, upon which the low-frequency variations are to be superimposed, is known as the "carrier wave," and we are mainly concerned here with the manner in which the audio-frequencies are combined with the carrier frequency and separated out again in the circuits of the receiving set.

Now in the first place it must be remembered that the carrier frequency is far above the highest audible frequency, and could not possibly produce any sound on its own account. During an interval between two items in a programme silence

How the Signal Reaches Your Set—

reigns (or should), although the carrier wave is being received at full strength the whole of the time. In order to convey an audible note from transmitting aerial to receiving aerial the intensity or amplitude of the carrier wave must be made to vary at the audible frequency in accordance with the wave-shape representing the note in question, and this process is referred to as "amplitude modulation." The amplitude of an oscillation is the maximum or peak value reached in each direction, and the low-frequency variation of the amplitude of the high-frequency carrier wave enables the audible note to be carried across.

A numerical example will be helpful in explaining the principle of amplitude modulation and in giving a sense of proportion as regards relative values. Suppose, for instance, that the frequency of the oscillations in a transmitting aerial is 1,000,000 cycles (1,000 kilocycles) per second, being the frequency of a station working on 300 metres. Currents of the same frequency are set up in the tuned circuits of a distant receiver, but when these currents have constant amplitude no sound would be given out by the loud speaker, a million cycles per second being far outside the audible range of frequencies.

Now suppose that the 1,000 kilocycle carrier wave is to convey between the transmitting station and the receiving aerial a single pure note of 500 cycles per second, being represented by a sine wave of this frequency. Then, by some suitable means, the high-frequency oscillations in the transmitting aerial are made to vary in amplitude, about the mean value, at a frequency of 500 cycles per second. Since the carrier frequency is one million cycles per second, it follows that for each cycle of the low-frequency variation (called the modulation frequency) there will be 2,000 high-frequency oscillations.

The constant-amplitude sine wave of Fig. 1 (*a*) represents the unmodulated

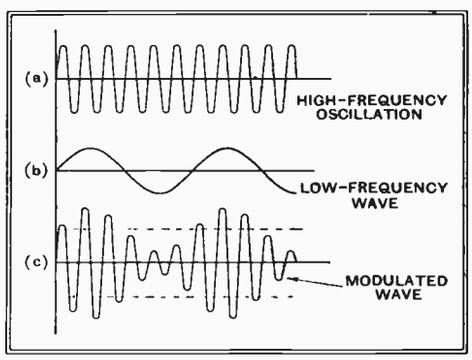

Fig. 1.—Diagram showing how the amplitude of a high-frequency oscillation is varied at an audible frequency.

high-frequency oscillations or carrier wave referred to, the frequency being 1,000 kilocycles per second. The sine wave at (*b*) represents the low-frequency variation corresponding to the pure tone of 500 cycles per second. By the action of the modulating system in the transmitting circuits these two waves are combined in such a way as to give the modulated wave of Fig. 1 (*c*). The lines passing through the positive and negative peak values respectively of the resultant high-frequency wave have exactly the same shape and frequency of variation as the low-frequency curve shown at (*b*). Of course, during each low-frequency cycle there will be 2,000 high-frequency oscillations, but for convenience in drawing only a few H.F. oscillations per low-frequency cycle are shown.

It will be observed that the number of complete reversals per second is the same for the modulated wave (*c*) as for the unmodulated wave (*a*), and so it is usual to state that the modulated wave is one of constant frequency but varying amplitude. This statement is, however, not strictly correct, because the term "frequency," as ordinarily defined, only applies to a wave which repeats itself exactly cycle by cycle, and similarly as regards the term "amplitude." So it must be understood that the frequency of a modulated wave means the number of complete or double reversals per second.

Percentage Modulation

When the amplitude of a high-frequency oscillation is varying periodically above and below the mean or normal value, the degree of modulation, or depth of modulation, is expressed as a percentage of the normal amplitude of the unmodulated wave. For instance, when the modulation is 20 per cent. the amplitude of the high-frequency oscillation varies between limits 20 per cent. above and 20 per cent. below the mean value. It is possible to modulate to a depth of 100 per cent., that is to say, to vary the amplitude of the high-frequency oscillations between zero and twice the normal value, but for practical reasons connected with the quality of reproduction at the receiver it is not usual to modulate to a greater depth than about 50 per cent.

It has been assumed that the unmodulated carrier wave represented by the curve of Fig. 1 (*a*) is a pure sine wave, and, this being the case, the modulated wave of Fig. 1 (*c*) is very frequently referred to as a high-frequency *sine wave* whose amplitude is varying periodically at the low, or modulation, frequency. This description, however, as already pointed out, is not strictly correct, for it is quite evident that the change in peak value, cycle by cycle, is brought about by changing the *shape* of each H.F. wave, the number of reversals per second being unaltered. But in the case under consideration there are 2,000 high-frequency oscillations to a low-frequency cycle, and so the difference in the amplitudes of two successive H.F. oscillations is very small indeed, their ratio being practically unity. Consequently, the extent to which the high-frequency oscillations depart from the true sine shape is extremely small, and the statement referred to above as being inaccurate may be employed in a descriptive sense. The idea of a sine wave gradually varying in amplitude is easy to understand; but such a statement would not be—indeed it could not be—tolerated by a mathematician working out the detailed theory of modulation.

Conditions at the Receiving End

The modulated ether waves reaching a receiving aerial set up in the latter high-frequency electromotive forces which vary in exactly the same way as the currents in the transmitting aerial. So when the H.F. oscillations in the sending system are modulated in any particular way, the resulting high-frequency electromotive forces in the receiving aerial are similarly

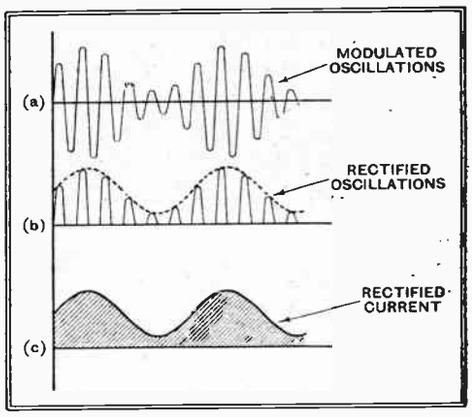

Fig. 2.—The curves show the process of separating out the low-frequency component from a modulated wave by means of a rectifier or detector.

modulated. Now if the receiving aerial circuit behaved like a simple resistance the currents set up in it would be at all times proportional to the voltage, and the resulting H.F. currents would be an exact replica of the currents in the transmitting aerial.

This would be a most desirable state of affairs, because the object is to obtain in the loud speaker an audio-frequency current which is as nearly as possible a true copy of that in the microphone circuit at the transmitting station. But it is a well-known fact that a sharply tuned receiving circuit has a modifying effect on a modulated high-frequency oscillation, the effect being to lessen or attenuate the degree of modulation.

The reason for this demodulating effect is that a certain amount of energy is stored in the tuned circuit when oscillations are present; this stored energy oscillates between the magnetic field of the coil and the electrostatic field of the condenser. The result is that any change in the amplitude of the high-frequency oscillation involves a change in stored energy, which is proportional to the square of the amplitude. Now it is a fundamental law of physics that energy cannot be accumulated or expended instantaneously, the result being that the high-frequency oscillations tend to resist any change in their amplitude, in the same way that a moving body, which possesses inertia, resists any change in its motion.

How the Signal Reaches Your Set—

The weakening effect is greatest at the highest modulation frequencies, so that the high notes tend to be reduced in greater proportion than the low ones. However, when the tuning is not too sharp, or when special filter circuits are employed, the quality of reproduction is not seriously affected on this score.

Function of the Detector

The modulated H.F. potential difference set up across the last of the tuned circuits in a receiver cannot be made to operate a loud speaker directly because, referring to curve (*a*) of Fig. 2, it will be seen that the curve is symmetrically placed about the zero line. Consequently, although the H.F. oscillations are modulated at low frequency, there would be no low-frequency current set up in the loud speaker coil. For this reason the low-frequency component or modulation frequency must be separated from the carrier wave again at the receiver, and this is the function of the detector stage.

The detector almost invariably takes the form of a rectifier, that is, a device which completely or partially cuts off all the negative half waves of the modulated oscillation by the property of possessing one-way or unilateral conductivity, in the manner shown by curve (*b*) of Fig. 2. A perfect rectifier could be defined as one which offers a constant resistance to current flowing in one direction, irrespective of the value of the current, but which allows no current whatever to flow in the opposite direction when the applied voltage is reversed. The static characteristic curve of a perfect rectifier is shown in Fig. 3 (*a*); the current is proportional to positive values of applied voltage and zero for negative values.

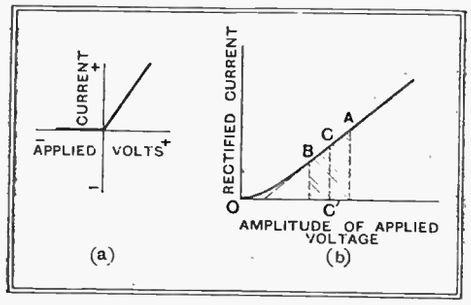

Fig. 3.—(a) The voltage/current or static characteristic curve of an imaginary perfect rectifier. (b) Representative rectification characteristic curve of a valve detector, such, for instance, as a diode.

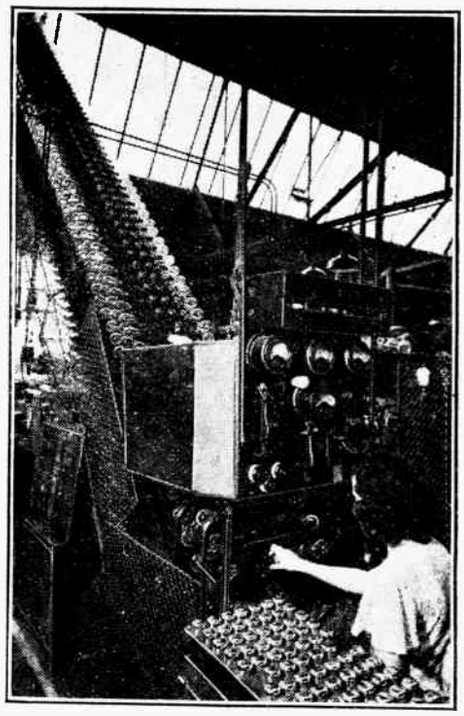
With such an arrangement the resulting unidirectional current produced when an alternating voltage is applied will have a *mean value* proportional to the amplitude of the applied voltage. If the applied voltage has constant amplitude the successive current pulsations will all be equal, but when a modulated high-frequency voltage is applied to a perfect rectifier the unidirectional current pulsations will vary in amplitude in accordance with the audio-frequency variations as shown at (*b*) in Fig. 2. By smoothing out the radio-frequency variations with the aid of a suitable condenser filter the resulting rectified current fluctuates at the low frequency, being at all times proportional to the *amplitude* of the high-frequency oscillation as indicated by the dotted-line curve. Consequently, with a perfect rectifier, proportionality is fully maintained and no distortion of the audio-frequency wave-shape is introduced.



On this equipment at the Cossor valve works valves are carried on a continuously moving band. After first being gettered, the valves are run under operating conditions to stabilise their characteristics before testing.

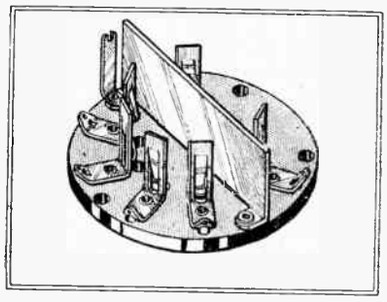
In practice it is usual to employ a thermionic valve of some kind as "detector," but, although there are several possible systems, there is not one which gives theoretically perfect rectification, because the relationship between the amplitude or R.M.S. value of the applied high-frequency voltage and the resulting rectified current is never represented by a straight line; they are not truly proportional to each other. This, of course, means that the effective resistance of the rectifier depends to some extent on the value of the applied voltage oscillation. Fig. 3 (*b*) gives a dynamic characteristic curve of a typical valve detector; although the curve is practically straight over a considerable portion of its length it is more or less curved at the lower end, and if the straight part is produced back it does not pass through the origin O.

Now if a high-frequency voltage, modulated to a depth of 100 per cent., were applied to a rectifier with such a characteristic, the rectified current would obviously not conform strictly to the variations in amplitude of the applied voltage, and distortion would result. But, as stated previously, in practice 100 per cent. modulation is rarely ever encountered and with a lower percentage modulation, distortionless rectification can be attained even though the rectification characteristic is curved at the bottom. This will be the case if the modulation is sufficiently shallow to ensure that the oscillation voltage amplitude fluctuates between upper and lower limits represented by two points such as A and B on the straight part of the curve, the wave, when unmodulated, having an amplitude OC′ represented by C midway between A and B. In these circumstances the change of rectified current is proportional to the change of applied voltage, being the necessary condition for distortionless rectification.

It should be realised that this condition can only be realised if the mean amplitude OC′ of the applied high-frequency voltage is sufficiently large to ensure that the upper and lower limits A and B, with the maximum degree of modulation, fall on the straight part of the curve. If the signal voltage were too low rectification would take place round the bend of the curve, with accompanying distortion. Consequently, for the reception of all but the strongest local transmissions it is essential to employ one or more stages of high-quency amplification before the detector.

HIGH-VOLTAGE VALVES

SEVERAL interesting developments have taken place in the design of Ostar-Ganz high-voltage valves, which, as most of our readers are aware, have heating elements designed for direct connection to either D.C. or A.C. mains of standard voltages without the intermediary of resistances or transformers.



Under-side of the new Ostar-Ganz valve-holder, showing screening plate.

Hitherto it has been impossible to obtain really high anode voltages from the indirectly heated rectifiers of the series; this difficulty is now overcome by the introduction of a voltage-doubling rectifier, which costs 22s. 9d. With a 220-volt supply a rectified output of about 440 volts is obtainable at 40 milliamps. Another new rectifier provides full-wave rectification.

The K.3560 three-electrode output valve is another interesting innovation; it has an A.C. resistance of only 500 ohms and a mutual conductance of 6 mA/V. The maximum D.C. anode dissipation is 15 watts, and the valve is specially designed to give a large output with normal supply voltages.

It has previously been necessary to employ double smoothing chokes in circuits employing Ostar-Ganz valves. The need for this special smoothing system has now been avoided by alterations in the arrangement of the pins and by the introduction of a special valve holder, in which the heater connections are effectively screened.

The agent for Ostar-Ganz valves in Great Britain is Mr. Eugen Forbat, of 28-29, Southampton St., Strand, London, W.C.2.

News of the Week

Current Events in Brief Review

The Passing of a Giant

WE understand that one result arising out of the Lucerne Conference is that the famous Eiffel Tower Broadcasting Station will cease its transmission on January 1st, 1935.

Marking Foreign Valves

THE Board of Trade's Standing Council recommends that certain imported wireless and rectifying valves should be plainly marked with the country of origin. The valves specified are thermionic valves having an anode dissipation that does not exceed 50 watts, and rectifying valves not exceeding a capacity of 60 volt-amperes or passing a current of more than one ampere. Such valves to carry a durable mark in a contrasting colour on the bulb or cap and a corresponding indication to be printed or stamped on the carton or container in which they are exposed for sale.

Guided by Music

AEROPLANE pilots in America find the broadcast programmes a pleasant means of whiling away the monotony of long flights, tuning back and forth from the special wavelengths carrying weather reports, direction signals, and landing instructions to their favourite broadcasting station along the route. The use of the direction-finding aerial makes it possible for a pilot while listening to a programme from WOR, for example, to know that he is heading in the right direction for the Newark airport.

The Obsolescent Crystal Set

IT is stated that one of the advantages to be gained by the new P.T.T. high-power station is that owners of crystal sets in Paris and its suburbs will be able to receive the programmes throughout the day, but the result of the return of the sets made in accordance with the new licence regulations would show that the declaration of crystal sets is negligible, those possessing these relics of the past are no longer using them. Strictly speaking, they are bound to declare them, but it is unlikely that the administration will go to the trouble of prosecuting them for their neglect.

Dr. Giesecke Returns Home

AMONG the various broadcasting chiefs who were recently compulsorily retired and sent to the internment camp at Oranienburg was the former Vice-President of the Broadcasting Union and Director of the Reichs-Rundfunk-Gesellschaft. We are glad to learn from our foreign correspondent that he, Dr. Giesecke, has been liberated, and that he returned home on August 23rd, though we understand that no mention of this fact appeared in the German Press.

Ultra Shorts at Sing Sing

SING SING is seeking permission to use ultra short waves to guard its prisoners. According to a Washington correspondent, the idea is that the warders would carry light-weight transmitters and receivers strapped on their backs, enabling them to converse across the prison grounds while on their beats.

Unlucky Tunis

TUNISIAN listeners want to hear French, and are loudly lamentating that they are doomed to absorb German, Italian, and other foreign comedies and lectures. Apparently the only French stations that are audible, viz., Radio Paris, Poste Parisien, Toulouse, and Algiers, are so "pursued by parasites" that five to ten minutes of listening is the utmost that can be borne.

Feeling the Economic Strain

THE Belgian Government has just decided to reduce the grant for 1933 to the National Broadcasting Institute from over 22 million francs to about 17 million. In consequence of this the I.N.R. (as it is generally known) has felt compelled to reduce both the talks and musical programmes. The broadcasting hours have been shortened to 12 noon to 2.0 p.m. and 5.0 to 10.0 p.m. on week-days. The Sunday transmission will start two hours earlier than this, but will otherwise be the same. It is hoped that when times improve the old hours may be restored or even extended.

Another Arctic Station

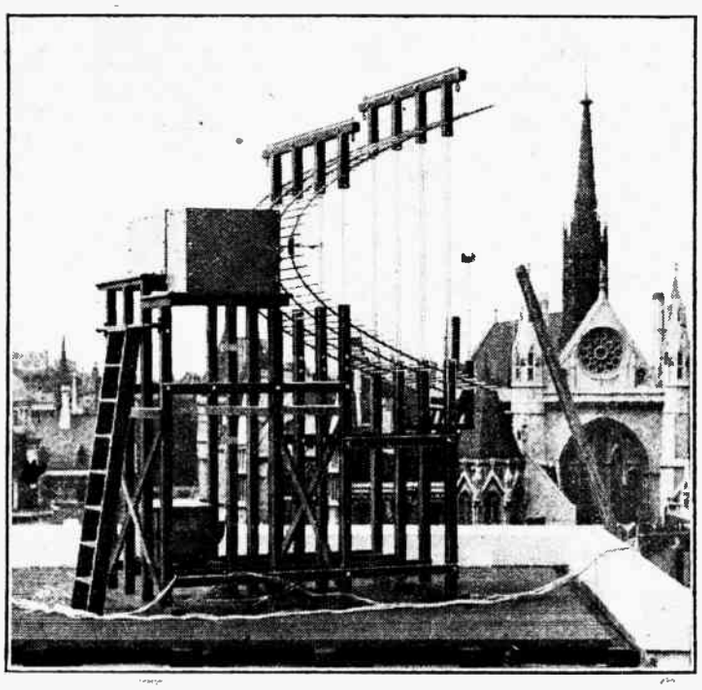
THE 10 kW. Norwegian station now being erected at Vadsö in Finnmark claims to be the most northerly station in the world, latitude 70° 4′ N. When completed it will relay the programme from Oslo.

Storms in Hungary

LOCAL thunderstorms frequently interrupt broadcast transmission in Hungary and the relay stations often have to shut down for "storm pauses." From Budapest now comes the assurance that listeners will be warned, at such times, which stations are affected and which are still continuing their transmissions, in order that they may tune in to the active station and continue to follow the programme.

Belgian Political Talks

IN view of the correspondence which has recently appeared in the English papers between three distinguished statesmen and the B.B.C. concerning the selection of speakers for the forthcoming political addresses, it is interesting to hear from our correspondent that the Belgian Government has issued a decree according to which "every one of its members has the right to use the broadcasting station for speeches up to a maximum of ten hours per month." If this is the case, Belgium stands in danger of being inundated with political addresses, and the prospect of an ardent politician insisting on his right to take the whole of his allotted time in "one fell swoop" must be rather disconcerting to listeners.



MICRO-WAVES AT ELECTRA HOUSE. The Research Department of Marconi's Wireless Telegraph Co., Ltd., has now settled down in its new quarters facing the Embankment, and one sign of the move is the erection of the parabolic aerial for the ultra-short wave beam on the roof of Electra House.

German Anti-Static Campaign

IN view of the forthcoming anti-interference law, the National Socialist Funkkammer has decided to clear the town of Baden-Baden of all man-made statics. Work has already begun under the direction of a Post Office engineer and the second burgomaster of the town, and it is hoped that by the middle of October all such interference will have ceased. The authorities have inferred that the law against man-made interference will be based on the technical requirements of the Volksempfänger (the new People's Receiver), so that every owner of this set will have clear reception without the necessity of providing shielded aerial down-leads.

Forthcoming Lectures

A NEW session of the British Radio Institution opens today (September 22nd), when a lecture will be given by Dr. L. E. C. Hughes on "The Reproduction of Sound via Radio." The meeting is to be held at 7.30 p.m. at King's College, Strand, W.C.2, and the chair will be taken by Prof. C. L. Fortescue. The Hon. General Secretary asks us to state that any of our readers who wish to attend what promises to be an interesting lecture will be welcomed. Invitation cards are available, but are not necessary for admission. The headquarters of the B.R.I. are at 36, Gordon Square, W.C.1.

R.S.G.B. Meetings

THE secretary of the Incorporated Radio Society of Great Britain has kindly sent us a preliminary list of the series of lectures which will be given on Friday evenings at 6.15 p.m. at the Institute of Electrical Engineers. The dates and subjects are:—

September 29th. — "Experiments with Portable 56 mc. Apparatus," by R. H. Hammans, G2IG.

October 20th.—"Technique in Valve Manufacture," by Stephen de Laszlo, B.A. (Director, High Vacuum Valve Co., Ltd.).

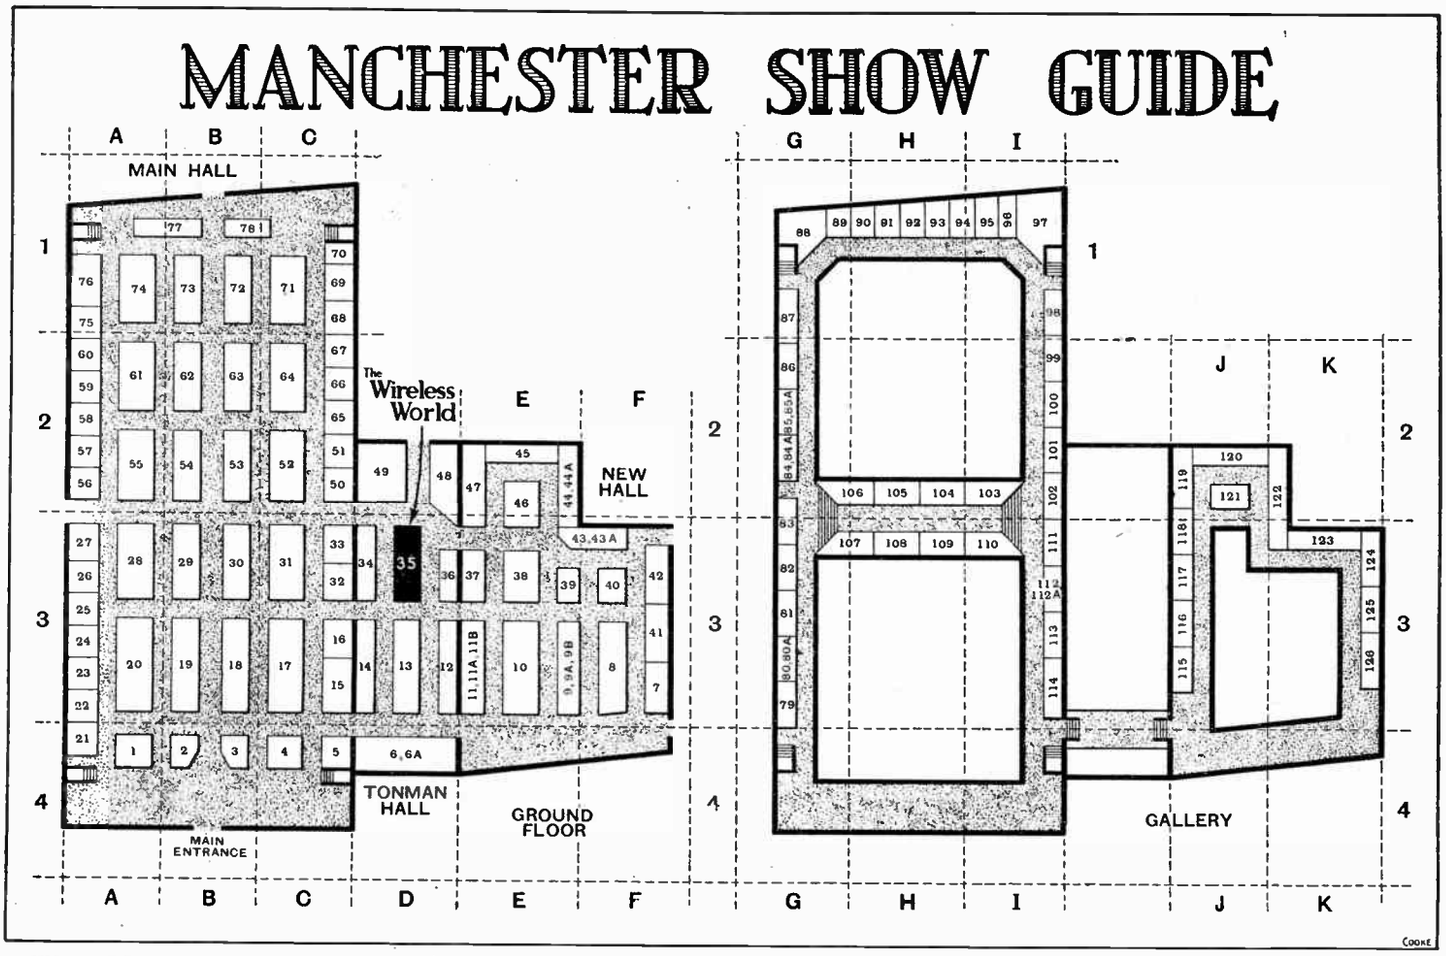
November 24th.—"The Magnatron Oscillator for very High Frequencies," by Eric Megaw, B.Sc. (Research Laboratories, General Electric Co.).

December 20th.—Annual General Meeting followed by a lecture, "Transmitting Valves for Amateur Needs," by L. Grinstead (Transmitting Division, Mullard Wireless Service Co.).

New German Relay Station

A NEW relay station from Coblenz will shortly be erected and further stations are projected for Würzburg, in Bavaria, and somewhere not yet settled in Pomerania.

MANCHESTER SHOW GUIDE



The Manchester Radio Show will be held in the City Hall, Deansgate, from Wednesday, September 27th to Saturday, October 7th, 1933

In the following list we give the names and addresses of exhibitors, with Stand numbers, and a reference (in heavier type) to be used in conjunction with the above plan for locating individual stands

FULL LIST OF EXHIBITORS

Exhibitor.	Stand.	Ref. Sqs.
AERIALITE, Ltd. ... ... Aerialite House, Amber St., Manchester.	85	G 2
Allied Newspapers, Ltd. ... ... Withy Grove, Manchester.	21–2	A 4, A 3
Amplion (1932), Ltd. ... ... 82–84, Rosoman St., London, E.C.1.	31	D 3
Automatic Coil Winder & Elec. Equipment Co., Ltd. ... ... Winder House, Douglas St., London, S.W.1.	118	E 3
BALCOMBE, Ltd., A. J. ... ... 52–58, Tabernacle St., London, E.C.2.	73	B 1
Belling & Lee, Ltd. ... ... Cambridge Arterial Rd., Enfield, Mddx.	27	A 3
Bernard Jones Publications, Ltd. ... 58, Fetter Lane, London, E.C.4.	76	A 1
Berry & Wilson, Ltd. ... ... Mansion Wks., Gt. Horton, Bradford.	79	G 3
Block Batteries, Ltd. ... ... Abbey Rd., Barking, Essex.	51	B 2
Britannia Batteries, Ltd. ... ... 233, Shaftesbury Ave., London, W.C.2.	2	B 4
British Blue Spot Co., Ltd. ... ... 94–96, Rosoman St., London, E.C.1.	50	C 2
British Broadcasting Corporation. ... Portland Place, London, W.1.	91–7	I 1

D.C. Superhet

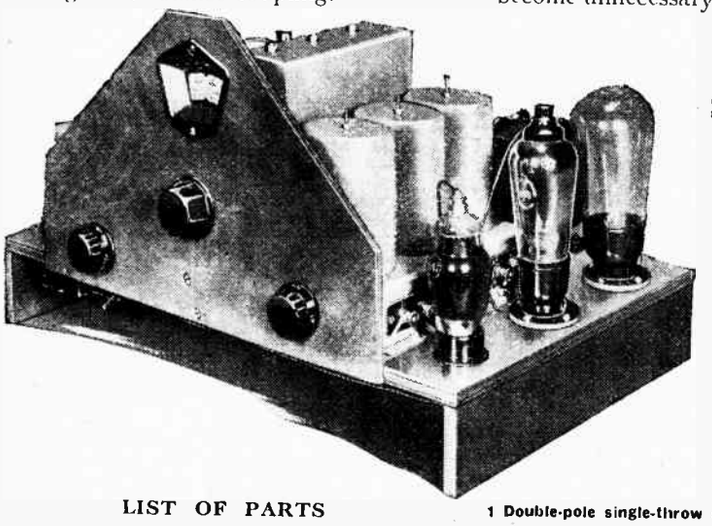
Incorporating A.V.C., Westectors and Pentagrid Frequency Changer

THE new receiver has only four valves, but is capable of a performance equal to, if not surpassing, that of a five- or six-valve set of only a few months ago. The reduction in the number of valves has been made possible by recent valve development and by the introduction of metal rectifiers for signal rectification.

A signal frequency H.F. stage with two tuned preselector circuits for second channel rejection precedes the Pentagrid frequency changer, and the single I.F. stage is coupled by means of iron-core type I.F. transformers. This stage feeds two Westectors, giving signal rectification and delayed A.V.C. on the H.F. frequency changer and I.F. variable-mu valves, and feeds the output pentode through a resistance coupling.

Due largely to this important feature, the A.V.C. system functions unusually well and maintains constant apparent loud speaker volume for large variations in signal input. In addition, the low value of L.F. amplification employed has far-reaching effects on the question of hum. A minimum of smoothing is needed, and yet the hum level is exceptionally low, even with a positive earth, while electrostatic hum pick-up is negligible.

The quality of the reproduction reaches a high level, while the selectivity and sensitivity are adequate for most purposes. The tuning dial is wavelength calibrated, and owing to the use of a special barretter for regulating the heater current of the valves, alterations to the set for different mains voltages between 200 and 250 volts become unnecessary.



New Superheterodyne Circuit Employing Four Valves Only.

Full size blue prints of the wiring connections will be available.

LIST OF PARTS

After the particular make of component used in the original model, suitable alternative products are given in some instances.

1 Super R.F. Radiopak, without volume control — **British Radiophone**
2 Ferrocart Colverdynes, 110 kc/s — **Colvern**
1 Tapered volume control, 0.25 megohm, and knob — **Claude Lyons Type 250 M-T** (Magnum, Rothermel, Varley.)
1 Potentiometer, 5,000 ohms — **Claude Lyons Type P.58** (Kinva, Varley, Wearite.)
1 Screened H.F. choke — **Goltone Type SHF**
2 Mains H.F. chokes — **Goltone Type PHF**
1 L.F. choke — **Heayberd No. 752** (Davenset, Ferranti, Parmeko, R.I., Sound Sales, Varley, Vortexion.)
5 5-pin valve holders — **Clix Chassis Mounting Type** (Preh.)
1 7-pin valve holder — **Philco 27/6005**
1 Grid clip, for 6A7 valve — **Philco 4897** (Claude Lyons.)
1 Fixed condenser, 4 mfds. 250 v. D.C. working — **T.C.C. Type 65**
2 Fixed condensers, 2 mfds. 200v. D.C. working — **T.C.C. Type 50**
3 Fixed condensers, tubular, 0.1 mfd. 350v. D.C. working — **T.C.C. Type 250**
1 Fixed condenser, 0.01 mfd. — **Igranic Type FF.12**
1 Fixed condenser, 0.001 mfd. — **Igranic Type FF.12**
1 Fixed condenser, 0.002 mfd. — **Igranic Type FF.12**
4 Fixed condensers, 0.0001 mfd. — **Igranic Type FF.12**
2 Fixed condensers, 0.0002 mfd. — **Igranic Type FF.12** (Dubilier, Peak, Telsen.)
1 Dry electrolytic condenser, 50 mfds. — **T.C.C. Type 521** (Dubilier, Telsen.)
1 Make-and-break switch — **Claude Lyons B.A.T.728**
1 Double-pole single-throw switch — **Claude Lyons B.A.T.2728** (British Radiophone, Bulgin.)
2 Ebonite shrouded terminals, A.E. — **Belling-Lee Type "B"** (Igranic.)
2 Westectors — **Westinghouse W.6**
1 Resistor, 25 ohms — **Claude Lyons Type FW.25**
1 Resistance, 100 ohms 1½ watts ... — **Seradex Type M.150**
1 Resistance, 250 ohms 1½ watts — **Seradex Type M.150**
1 Resistance, 20,000 ohms 1½ watts — **Seradex Type M.150**
1 Resistance, 0.1 megohm 1½ watts — **Seradex Type M.150**
2 Resistances, 0.25 megohms 1½ watts — **Seradex Type M.150**
1 Resistance, 0.5 megohm 1½ watts — **Seradex Type M.150**
1 Resistance, 1 megohm 1½ watts — **Seradex Type M.150**
1 Resistance, 2 megohms 1½ watts — **Seradex Type M.150**
2 Resistances, 10,000 ohms 2½ watts — **Seradex Type G.250** (Dubilier, Erie, Claude Lyons, Varley, Watmel.)
1 5-pin plug — **British Radio Gramophone Co.** (Bulgin.)
1 Bulb, 6 volts 0.15 amp. — **Bulgin Type "OB"**
1 Twin safety fuse holder, with 1 amp. fuses — **Belling-Lee Type 1033** (Bulgin.)
1 Length Screened Sleeving — **Harbros**
Plymax baseboard, 10in. × 16in. × ⅜in. — **Peto-Scott** (Overall dimensions of assembled chassis, 16in. length × 10in. width × 9½in. height.)
1 Voltage regulator — **Osram Barretter No. 251**
4 oz. No. 20 tinned copper wire, 10 lengths Systoflex, wire, wood, etc.

Screws:—
25 ¼in. No. 4 R/hd. — 10 ⅜in. No. 4 R/hd.
4 ½in. No. 4 R/hd. — 10 ½in. No. 4 R/hd.
7 ⅝in. No. 4 C/sk. — 4 6BA. with nuts and washers.

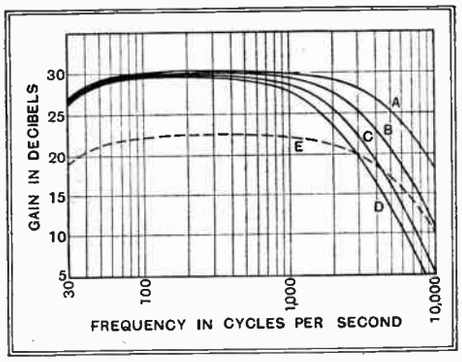
Valves:—2 Marconi or Osram VDS. 1 Marconi or Osram DPT. 1 Philco or Claude Lyons 6A7.

G.E.C. Six-watt Power Amplifier

Two-stage A.C.-operated Power Unit in Compact Form

Model B.C.S.1562

THE B.C.S.1562 power amplifier made by the General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2, is an A.C.-operated two-stage unit giving a maximum undistorted power output of six watts. An output of this order is sufficient to fill a small- or medium-sized hall, and with suitable disposition of loud speakers will answer for many purposes out of doors, such as at sports meetings, garden fêtes, and the like. Yet on first acquaintance few would include it in the category of public address equipment in view of its exceptionally small size, for the overall dimensions are but 13in. x 6¼in. x 10¼in. high. Despite its compactness, there is no undue crowding of the components, nor has the safety factor in a single instance been pared down to the border line to achieve this end; indeed, the components are very generously rated.



Overall response curves of G.E.C. six-watt amplifier taken across the 15-ohm tapping of output transformer. A, normal characteristic, B, C and D with three degrees of tone control, and E, low grain characteristic.

The circuit employed is quite straightforward, and consists of an Osram MS4B S.G. valve resistance-capacity coupled to a PX25 power valve. The A.C. output from this is fed through a choke-capacity filter to an output transformer having tappings on its secondary winding to give correct matching for loud speakers of 2.5, 5, 7.5, and 15 ohms impedance. Alternatively, if two or more loud speakers are employed the wide choice of output ratios renders it comparatively easy to arrange their connections so that the total impedance of the line amounts to one of these four values. The provision for low impedance transmission lines is a wise one, for with the loud speakers located at a distance little or no loss occurs of the higher frequencies due to capacity effects.

Alternative Input

Control of volume is effected by a 500,000-ohm potentiometer in the grid circuit of the first valve, but, in addition, provision is made to reduce the input to about one-half should the need arise. A switch, marked "High Gain" and "Low Gain," is fitted, and in the former position an input of about 0.22 volt suffices to fully load the amplifier, while 0.56 volt approximately is required under low-gain conditions. A volume control of one-half megohm may seem unduly high, but it allows the amplifier to be employed following the detector valve in a wireless unit, and, furthermore, enables separate volume controls, or fading devices, to be used where two gramophone turntables or a combination of these and a microphone unit are connected to the amplifier.

Three degrees of tone control are available, but not for compensation of the amplifier's characteristic, which is entirely satisfactory without this artificial aid. They are included in order to meet any particular contingency that may arise in connection with the acoustic properties of the hall or the loud speakers. The high-tension supply is derived from a full-wave rectifying valve (Osram U.14), the output being smoothed by a single choke and the customary array of condensers.

Anode and grid decoupling is applied where necessary, with the result that entire freedom from interstage coupling is achieved, and the amplifier is perfectly stable under all conditions of working.

The only precautions we found necessary, and this applies also to all high gain amplifiers, was to shield the gramophone pick-up leads and earth the outer covering as well as the metal parts of the tone arm.

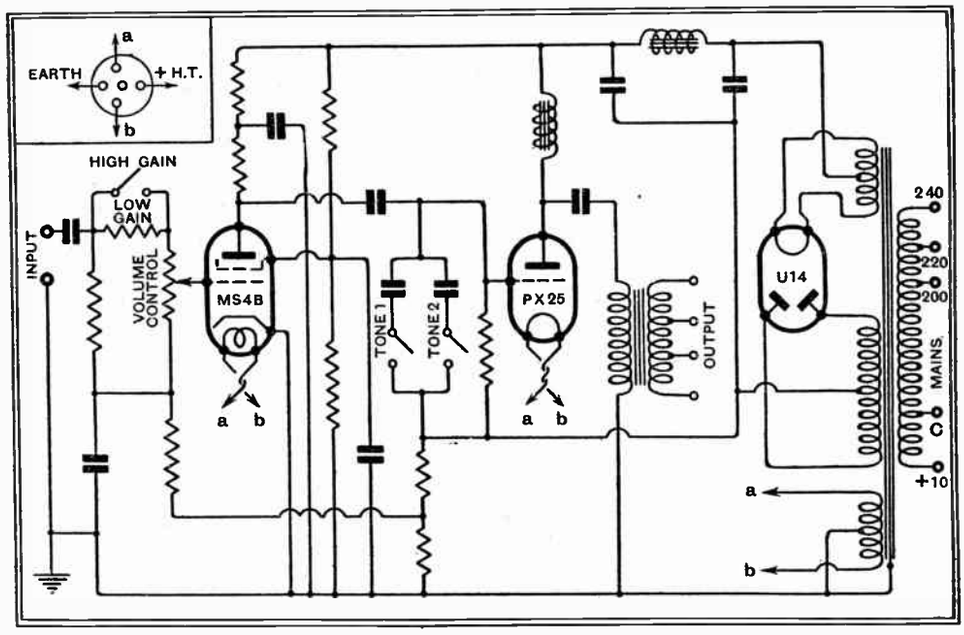
Good Characteristic

The performance of the amplifier gives no grounds for adverse criticism; gramophone recordings are reproduced faithfully, all of which is in keeping with expectations, having regard to the very satisfactory response curve. A brief explanation of this is necessary, for it may be thought at first that it represents the total gain of the unit. In order to ascertain the overall response, including the output transformer, our measurements were made by joining a 15-ohm non-inductive resistance across the 15-ohm impedance tapping. The decibel scale should be used for relative computaton of the output only at different frequencies with and without tone compensation. It also shows the relative level with the switch in the low gain position.

Curve A is the normal characteristic of the amplifier. For curve B tone control switch No. 1 was depressed; curve C shows the characteristic of the amplifier with the next degree of tone control, while with the full measure available curve D resulted. With the input switch set to "Low Gain" and without tone compensation we obtained the broken line curve, marked E on the graph.

Provision is made to take the necessary operating voltages for a microphone unit from the amplifier. At the back of the chassis is a sunk five-pin valve holder at the filament sockets of which is available a four-volt A.C. supply, while the anode and grid sockets give access to the smoothed D.C. line.

To sum up, the G.E.C. model B.C.S.1562 amplifier satisfactorily fulfils the various functions for which it is intended. It is of sound electrical design without frills or unnecessary complications likely to introduce annoying troubles, and, finally, the workmanship and finish are quite above criticism. Its compactness makes it readily portable and easily stowed away when not in use, and at the attractive price of £18 15s., complete with valves, represents very good value for money.



Theoretical circuit of G.E.C. B.C.S.1562 six-watt power amplifier.

BROADCAST BREVITIES

By Our Special Correspondent

Time Signals

THE B.B.C. has long been anxious to arrange a fixed schedule for the hours at which the Greenwich time signals are transmitted to avoid the annoyance caused when the "six pips" are superimposed on an interesting programme or when the expected signal is postponed. They hope now to arrange that the time signals in future will always be heard at fixed times, and that they will not interfere with musical or other programmes.

North Regional Dramatic Producer

THE organisation of the staff for the North Regional area proceeds apace. I understand that Mr. Robin Whitworth has been appointed the dramatic producer, working under Mr. E. F. R. Harding, the recently appointed director of programmes.

The Children's Hour

I UNDERSTAND that no decision has yet been made to omit the customary birthday greetings from the Children's Hour, but that the matter is receiving serious consideration. The B.B.C. recognises that the omission may cause acute disappointment to many children, but with the development of the Children's Hour from the informal entertainment of a gathering of "Uncles and Aunts" to its present more serious forty-five minutes, the birthday lists have grown to such a length that it is felt that they now occupy too much of the time and may have to be reluctantly abandoned.

Empire Broadcasting

THE change in the announcements of the different programmes transmitted on the Daventry short-wave sets is merely one of nomenclature. After October 8th the various Empire programmes will be known as No. 1, No. 2, and so on. Thus instead of announcing a programme for "The Canadian Zone," it will in future be known as "Programme No. 5." It has been found that there was so much overlapping of the formal zones that, in practice, the attempt to allot a certain programme to any certain zone was impossible.

Mr. Roger Eckersley's New Title

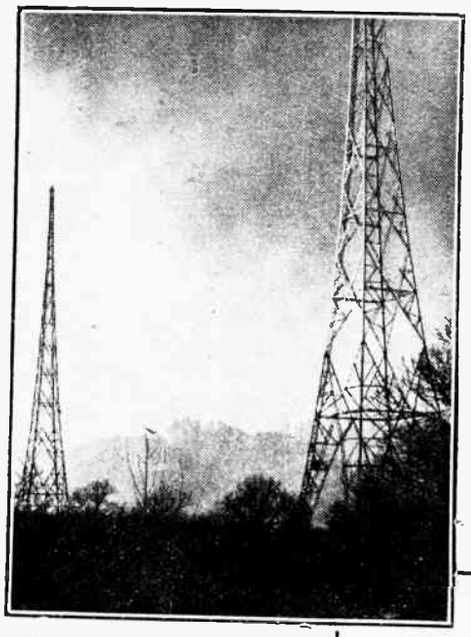
THE announcement that Mr. Roger Eckersley is now the "Director of Entertainments" only indicates a change in the name of his official post. It was found that some confusion arose occasionally between the respective posts of "Director of Programmes" and "Director of Talks," it was therefore decided to make it clear that the Director of Entertainments and the Director of Talks are two separate and hard-worked individuals, who together are responsible for the entertainment and instructional sides of the programmes.

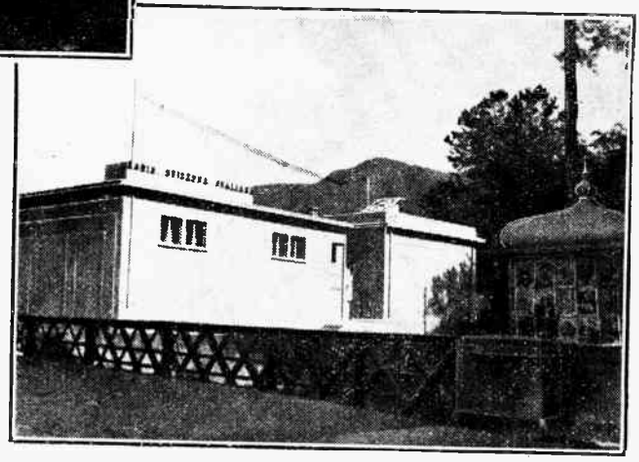
Transatlantic Relays

THE interchange of programmes between Europe and America appears likely to receive a fresh impetus from the formation of an International Committee to organise the broadcasting of talks, debates and discussions by prominent speakers in Europe, Asia and America. Dr. Nicholas Butler, president of Columbia University, is chairman, and the committee includes distinguished representatives from England, and practically all European countries, together with China and Japan. The scheme is under the auspices of the Columbia Broadcasting System, and may be regarded as their answer to the National Broadcasting Company of America, whose interchange of programmes, following the visit of Mr. F. Bate to this country, first brought to public notice the possibilities of transoceanic broadcasting.

Prospective "General Post"

ON the completion of the new National station at Droitwich it is possible that the existing medium wave National transmitters at Brookmans Park, Moorside Edge and Watchet may become redundant, but in that case it is probable that two of the transmitters will be transferred to the projected North-East of England and North of Scotland Regional stations, while the third may be re-erected at Droitwich as the new Midland Regional transmitter.





SILENT FOR A TIME. The splendidly situated masts of the Italian-speaking station at Monte Ceneri and the studio in Lugano. This station is at present closed down while the transmitters are adjusted to the new wavelength.

The Disgruntled Statesmen

THE recent correspondence between three eminent statesmen and the chairman of the B.B.C. with regard to their non-inclusion in the list of speakers to broadcast forthcoming political addresses has aroused considerable interest. Many listeners, myself included, would welcome the opportunity of hearing addresses by Sir Austen Chamberlain, Mr. Lloyd George and Mr. Winston Churchill, also by Mr. Maxton and many other prominent politicians, but those in authority at the B.B.C. wisely set a limit to the time allotted to political speeches, fearing that a plethora of such addresses would only weary listeners and thereby defeat their own object. They therefore decided, for the coming season at all events, to limit the speakers to those chosen by the leaders of the three main parliamentary parties. In the good old days when "every little boy or gal . . . was either a little Liberal or else a little Conservative," the task of selection would have been simplified, but now that there are so many shades of political thought it becomes complicated and necessarily leads to some dissatisfaction.

The New Aberdeen Studios

IT is right that Aberdeen, the home-town of Scotland's New Regional Director, Mr. Dinwiddie, should be equipped with the most up-to-date studios, but I must confess to surprise when I dropped in at the newly designed studios in Belmont Street last week.

Broadcasting House in Miniature

There will be a Press view soon, and meantime those in authority have decreed that no detailed account must appear, so I am debarred from describing the new talks studio, rigged up with the now familiar "traffic signal" system of lights for communicating between the control engineer and the speaker, of the twin gramophone turntables and the modernistic fittings and furniture, the whole giving the appearance of having been lifted lock, stock, and barrel from Broadcasting House, London, while the concert studio will certainly be Scotland's finest.

Mr. Dinwiddie's Slogan

I can, however, say this: Mr. Dinwiddie is already on the warpath with the slogan, "A fair chance for every town in Scotland," and the probability is that broadcasting studios will be erected in other Scottish centres, and a start can be expected in the region of Inverness.

"The White Château" Again

LISTENERS will welcome the opportunity of again hearing that popular broadcast play, "The White Château," which will be revived on October 9th and 10th with incidental music specially composed by Norman O'Neill.

Practical HINTS and TIPS

AIDS TO BETTER RECEPTION

SO far as the "one H.F." receiver is concerned, it is generally best to carry out the operation of adjusting the trimming condensers while the reaction control is advanced towards its limit. Although the best form of reaction control does not introduce much change in tuning, there is always the possibility of some slight disturbance being introduced, and so it is desirable that the circuits should be in most accurate alignment when the set is in the most sensitive condition—that is, with reaction fully advanced.

Reaction and Ganging.

IN the "Hints and Tips" section of *The Wireless World* of September 1st a note was published on the advantages of inserting an anti-interference filter in the mains supply leads at the point where they enter the building. The purpose of such a filter is, of course, to dispose of interference of a high-frequency nature, which may have been superimposed on the mains current by electrical machinery, etc., connected to the same mains supply system, but perhaps at a considerable distance.

Filtering and Electrical Supply.

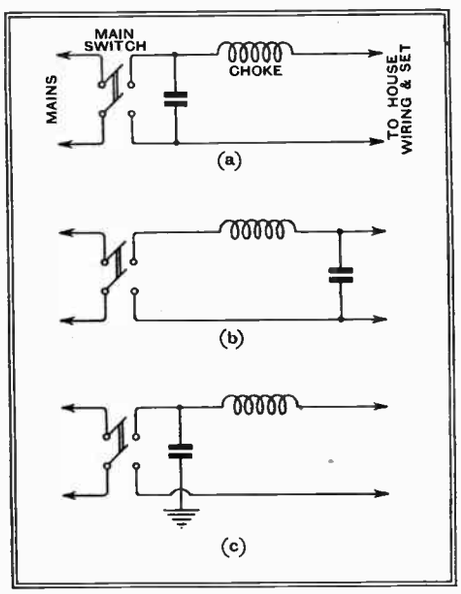


Fig. 1.—Simplified mains filters with a single choke.

As a footnote to what has already been said on the subject, it should perhaps be pointed out that in some cases the filter may be simplified and cheapened by using a single choke instead of a pair of chokes. It is therefore suggested that one or other of the arrangements shown in Fig. 1 should be tried, if only for the reason that the use of a single choke introduces less loss of voltage; looked on in another way, it becomes less important to use a choke of extremely low D.C. resistance.

Referring to the diagram, it will be seen that the various arrangements suggested differ only with regard to the position of the by-pass condenser. In circuits (*a*) and (*b*) this condenser is respectively connected on the "input" and "output" sides of the filter, while in diagram (*c*) one side of it is connected directly to earth. It can only be determined by trial which arrangement will give best results, and, above all, it must be remembered that it will depend on circumstances in which mains lead the choke should be inserted.

THE practice of fitting some form of tone control whereby heterodyne interference may be minimised by reducing the high-note response of the receiver is now fairly common. Unfortunately, most of the methods adopted are somewhat crude and extremely drastic in their action. True, many of them are effective enough in suppressing certain forms of interference from stations working in adjacent channels, but music is quite lifeless, and speech has lost much of its intelligibility.

The Best Whistle Suppressor.

This is mainly due to the fact that the filters fitted have a "tailing characteristic"; they begin to attenuate at frequencies of the order of 2,000 cycles per second to an appreciable extent. The heterodyne whistle between adjacent stations, if it is worth while trying to remove it, is of considerably higher frequency than this, and it is not hard to see that the ideal arrangement should only come into operation at a suitably chosen point in the spectrum (actually about 3,500 kc/s), leaving the upper middle register at full strength.

In the New Monodial receiver a scientifically designed low-pass filter of this nature is fitted and is so arranged that it may be thrown into circuit when heterodyne interference is present. At other times full advantage is taken of the wide frequency response of the receiver.

To hear a filter of this type in operation is a revelation of what can be done. With the receiver tuned to a station suffering from interference, and while the filter is out of operation, one hears a distressing background of whistle, mixed with sideband "splash," which may be so bad that the transmission has no entertainment value. Then, at a turn of the switch, the interference disappears as if the unwanted station had suddenly shut down.

The purpose of this note is to point out that the same type of low-pass filter is also applicable to other receivers, more especially to those which have an intermediate L.F. stage. The main requirements are that the filter should work with input and output impedances of roughly 10,000 ohms; this means that the preceding valve and the succeeding coupling device should have roughly that impedance value. If transformer coupling be employed, it will be necessary to reduce impedance artificially by shunting the primary with a 10,000-ohm resistance.

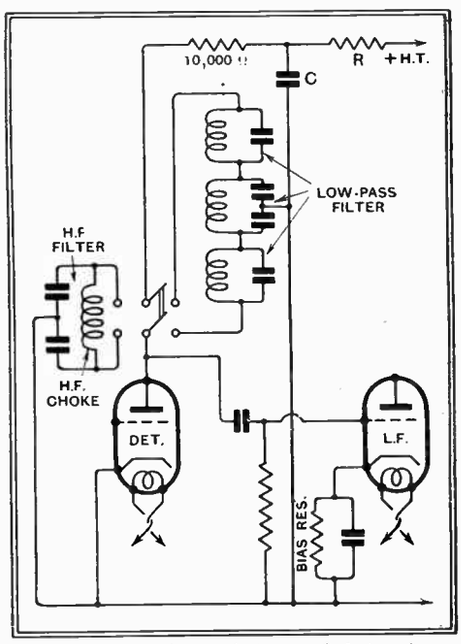

Fig. 2.—An advanced type of heterodyne whistle filter which may be thrown into circuit at will. The ordinary decoupling components are marked R. and C.

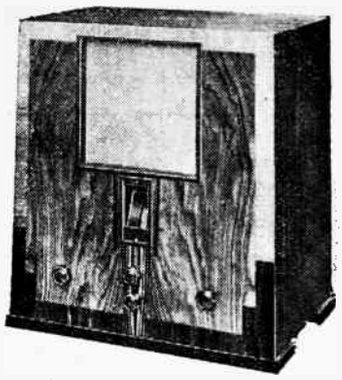
The connections of the low-pass filter unit are shown in Fig. 2. With the switch in the right-hand position the filter is in circuit, while in the other position the ordinary H.F. stopping devices become operative.

LOW-FREQUENCY transformer ratio is often a matter of considerable importance, especially in view of the fact that, in most modern sets, the detector is arranged to feed directly into the output valve without an intermediate L.F. stage. It is seldom that the typical grid detector provides a large surplus of undistorted output, and so the result of using an insufficiently high step-up ratio is likely to be serious.

An Important Link.

It should be remembered that the detector output required for loading the output stage is directly proportional to the voltage step-up provided by the transformer. If, for example, a ratio of 1 : 2.5 were employed in a set where 1 : 5 was specified, twice the detector output would be needed for correct operation.



H.M.V. "Superhet Concert Seven"

MODEL 467

FEATURES. ***Type.*** *— Seven-stage table-model superheterodyne receiver with automatic volume control. Moving-coil loud speaker and provision for pick-up and external loud speaker.* ***Circuit.*** *— Signal frequency H.F. — oscillator — first detector — I.F. amplifier — metal oxide second detector — first L.F. with tone control — triode output valve. Full-wave valve rectifier.* ***Controls.*** *— (1) Main tuning with optically magnified illuminated scale. (2) Volume control and "Static Suppressor." (3) Duplex tone control. (5) Waverange, gramo. and on-off switch.* ***Price.*** *— 22 gns.* ***Makers.*** *— The Gramophone Co., Ltd., 98-108, Clerkenwell Road, London, E.C.1.*

A Receiver of High Performance on All Points

THE specification of this table-model receiver, having regard to its compact design, is remarkably full, and the numerous detail refinements in the circuits and controls indicate that no pains have been spared to secure the highest possible performance under modern receiving conditions. The cabinet is very similar in size and general design to that of the Model 438 reviewed in our issue of June 16th, 1933, but instead of dual vertical tuning scales there is a single illuminated drum dial which is viewed through a magnifying glass prism.

There are seven valves and seven stages in the circuit, excluding the power rectifier, the reason being that a metal oxide rectifier is used in the second detector stage. Selectivity at signal frequency is provided by the first stage, which is preceded by a band-pass tuner. Separated valves are employed for the oscillator and first detector, and two band-pass filters tuned to 117 kc/s are associated with the single I.F. stage. The metal oxide second detector is tapped across a portion of the secondary of the output I.F. transformer, while a second metal oxide rectifier for automatic volume control derives its input from the primary winding. Both the first H.F. valve and the first detector are controlled, and a delay voltage is supplied by a potential divider resistance across the H.T. supply.

In addition to the A.V.C. bias on the first valve there is a variable cathode bias resistor which is fitted at the back of the chassis, and may be pre-set to give a volume level suited to local conditions of background noise. The full magnification of the set is obtained at any time by pushing inwards the main volume control spindle. This actuates a shorting switch connected across the "Static Suppressor" control resistance.

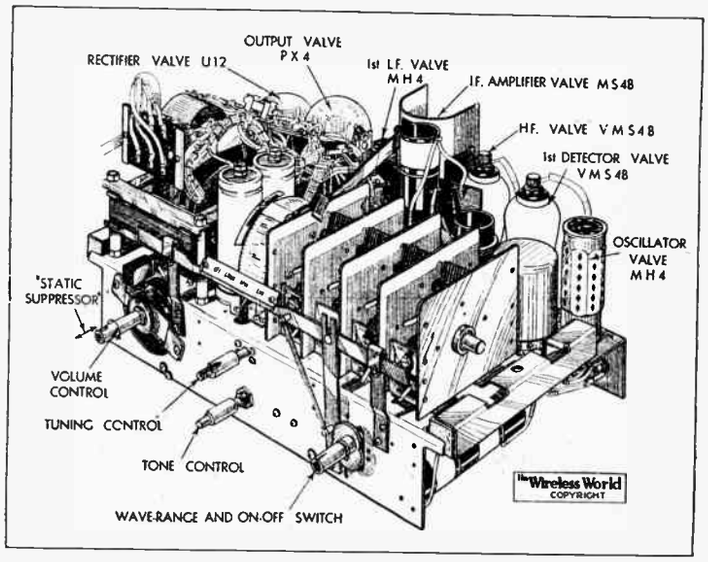
The manual volume control follows the second detector and functions both on radio and gramophone. There are two L.F. stages—both triodes—the output valve giving 2½ watts undistorted. The coupling between these stages is of the parallel-fed transformer type, and incorporates a tone control circuit which is worthy of the name. It controls both high- and low-note response, and is operated by two variable resistances coupled together. There is a mid-position which can be felt by a notch in the control, and movement to the left increases the low and to the right the high notes.

The power transformer is of unusually generous proportions, and is protected by a fuse in the centre connection to the H.T. winding and a "heat coil" in series with the primary winding. The latter is a special type of thermally delayed fuse which breaks down for steady currents in excess of 0.6 amp., but stands up to brief surges which may occur while the set is warming up.

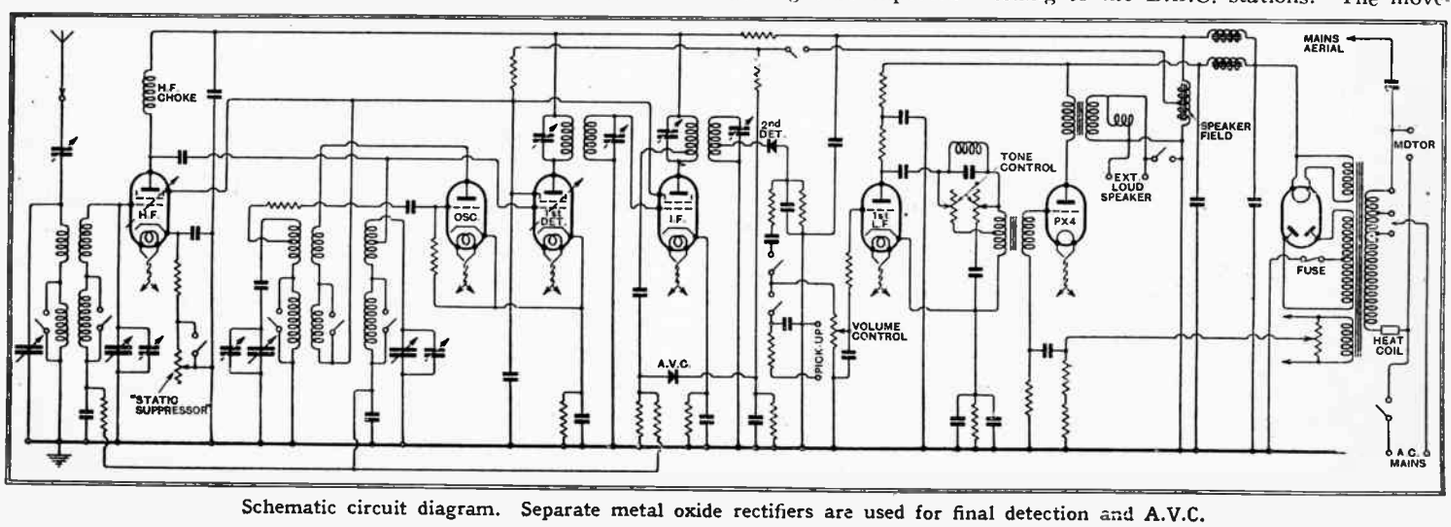
The range is all that might be expected from seven stages, and there is an ample reserve of magnification for use when conditions permit. There is not the least doubt that this set will receive any station above the prevailing noise level, and will do so, moreover, without calling for special skill on the part of the operator. At no time during the course of our tests did we find it necessary to make anything like full use of the overall amplification of which the set is capable.

The makers claim adjacent channel selectivity, and in Central London on a 50ft. outdoor aerial the set could be tuned to Mühlacker without any trace of modulation interference from London Regional. Few receivers we have tested have equalled this performance in the matter of selectivity. On long waves the range and selectivity are equally good.

The high selectivity has not been gained at the expense of quality, however, and the tonal balance with the set properly tuned and the tone control in the mid-position is, in our opinion, just right when listening to the B.B.C. stations. The move-



For a seven-stage circuit the chassis is remarkably compact.



Schematic circuit diagram. Separate metal oxide rectifiers are used for final detection and A.V.C.

H.M.V. "Superhet Concert Seven"—
ment of the silk covering the loud speaker fret affords proof of the amplitudes which are developed in the bass, but the set is free from the slight over-emphasis of low tones which we have noticed in some earlier H.M.V. sets. One's personal predilections in the matter of quality are easily satisfied by the tone control, which is one of the most satisfactory we have so far handled.

A careful search of the medium waveband failed to reveal any whistles due to second channel interference, and as no special circuits have been included to suppress these the success achieved must be attributed to the high selectivity at signal frequency.

It is indicative of the satisfactory working of the A.V.C. that with the manual volume control once set for the local station no further adjustment is required when turning to the principal European stations.

Next Week's Set Review:

PHILIPS 634A SUPERINDUCTANCE RECEIVER

LABORATORY TESTS

A Review of Manufacturers' New Products

PENTAGRID VALVES

A NUMBER of American Pentagrid valves, intended for use as combined oscillator and first detector valves for superheterodyne frequency changing purposes, has been submitted for test. The valves are listed as the 6A7 type, and have a heater rated to consume 0.3 ampere at 6.3 volts; they are designed expressly for use in car radio sets where the 6-volts accumulator may rise to a considerably higher voltage when on charge, hence the peculiar voltage rating. It is stated by the makers that considerable latitude in the heater potential is permissible.

The valve is of the indirectly heated type, and contains five grids and an anode. The two inner grids form the control grid and anode of the oscillator, while the next is a screen grid arranged to screen the oscillator electrodes from the others. The remaining electrodes form the control grid, screen grid, and anode of a variable-mu tetrode which is used as the first detector. No external mixing circuit is required, and the oscillator coupling is obtained internally through electronic action.

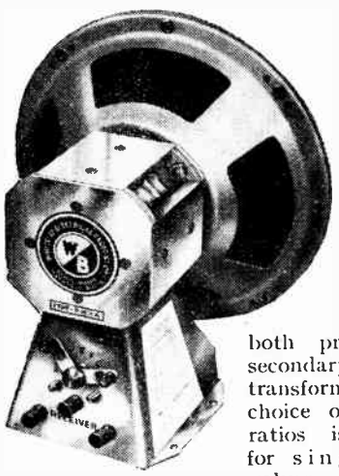
On test, the valve gave an entirely satisfactory performance, and proved superior from every point of view to the conventional two-valve frequency changer. Although the valve is primarily intended for battery operation in a car set, it can also be used in a D.C. mains set, and tests indicated that it would give a satisfactory performance when used in this manner. It may also be operated from A.C.

Another Pentagrid with similar characteristics, the 2A7, but with a heater rated to consume 0.8 ampere at 2.5 volts is available, and this is suitable for use in the New Mono-dial Super. The makers are the Philco Radio and Television Corp. of Great Britain, Ltd., Aintree Road, Perivale, and the price is 16s.

6A7 Pentagrid with a heater rated at 6.3 volts 0.3 ampere.

W.B. TYPE PM4A SPEAKER

AS in most of the W.B. range of loud speaker units this year, the model tested was fitted with the "Microlode" output transformer and switching device. There are two switch arms controlling tappings on both primary and secondary of the transformer, and a choice of seventeen ratios is available for single output valves and four ratios for push-pull stages requiring a centre tap. The change, both in volume and quality, on varying the step-down ratio is most marked, and the load can be rapidly adjusted to give the best results.



W.B. type PM4A permanent magnet loudspeaker incorporating the "Microlode" matching device.

Tested with the load adjusted to the calculated value, the efficiency was found to be exceptionally good for a permanent-magnet unit. Above 100 cycles it was equal to that of our standard 10in. energised unit.

The PM4A is also remarkable for the excellent response at the extreme top. Between 7,000 and 9,000 cycles it has a better output than any small commercial unit so far tested. There is a small resonance at 4,500 cycles, a more pronounced one at 2,500 cycles, and the bass resonance occurs at 130 cycles, below which the output falls steadily to a cut off at about 75 cycles.

The price of the new PM4A, which is made by Whiteley Electrical Radio Co., Ltd., Victoria Street, Mansfield, Notts, is 42s.

GOLTONE H.F. CHOKES

THE type P.H.F. heavy-duty H.F. choke has been designed especially for use in circuits passing currents of a greater magnitude than can be dealt with safely by the normal H.F. choke. It is particularly suitable for including in the heater supply circuits of a D.C. mains receiver and for certain types of interference suppressor devices where the current flowing does not exceed 0.35 amp.

Measured at a frequency of 1,000 c/s its inductance was 10,000 microhenrys approximately, yet its D.C. resistance is only 17.6 ohms. The choke is wound on a 10-section former and measures 4½in. high, the base being 2½in. × 1¾in. overall, and the price is 7s. 6d.

The standard model for use in H.T. smoothing circuits is made in two styles: the type S.H.F. and the type S.S.H.F.

Goltone heavy-duty and screened-type H.F. chokes.

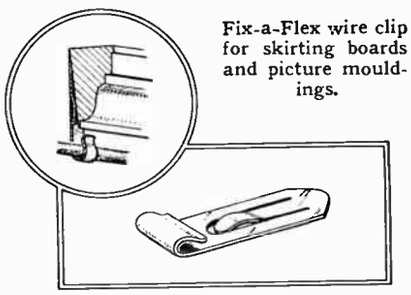
Both models are screened, the principal difference being that the type S.S.H.F. is provided with a screened lead for joining to the anode terminal of S.G. valves. The specimen tested showed an inductance of approximately 200,000 microhenrys at a frequency of 1,000 c/s, its D.C. resistance being 490 ohms. This choke will carry up to 50 mA. with safety, and the price is 4s. 6d.

The makers are Ward and Goldstone, Ltd., Frederick Road (Pendleton), Salford 6, Lancs.

FIX-A-FLEX WIRE CLIP

AN ingenious clip for fixing flexible wires such as loud speaker extensions, earth lead, etc., to skirting boards, picture mouldings and other woodwork in the room, has been introduced by N. Johnson, Fix-a-Flex Works, 35a, South Park Road, Wimbledon, London, S.W.19.

It consists of a stout brass strip, bent at one end into a loop for the wire, the other being slightly pointed and having a tongue-piece stamped out. It is fixed in position by inserting the pointed end between the woodwork and the wall; if the gap between these is too wide to afford a secure grip the tongue-piece can be opened out until a secure fixing is obtained.



Fix-a-Flex wire clip for skirting boards and picture mouldings.

They are distributed through Houghton (Ensign, Ltd.), High Holborn, London, W.C.1, and cost 1s. 6d. a box containing one dozen.

WHARFEDALE LOUD SPEAKERS

IN connection with our review of these units on page 220 of our September 8th issue, we are asked by the makers to state that the price of the "Golden" model has now been reduced from 63s. to 55s.

"Did you notice one of the radio journals says the 'Microlode' was probably the high spot at Radiolympia?"

"I can quite believe it. Perfect matching has certainly made a difference to MY set!"

ACCURATE MATCHING AT LAST!

W B

● 17 transformer ratios for really accurate matching to ANY power valve or pentode and 4 ratios for Class B or QPP *all available on one speaker* by a simple switch adjustment! ● Added sensitivity due to the 'Mansfield' magnetic system! Better balance through really accurate matching! The difference in performance must be heard to be believed.

'MICROLODE'

(Regd. Trade Mark)

Type PM4a-42/- Type PM6-32/6

MOVING-COIL SPEAKERS

With the new Microlode feature and the famous 'MANSFIELD magnetic system.

Write for the MICROLODE folder.

We are exhibiting at the Manchester Radio Exhibition Sept. 27 to Oct. 7.

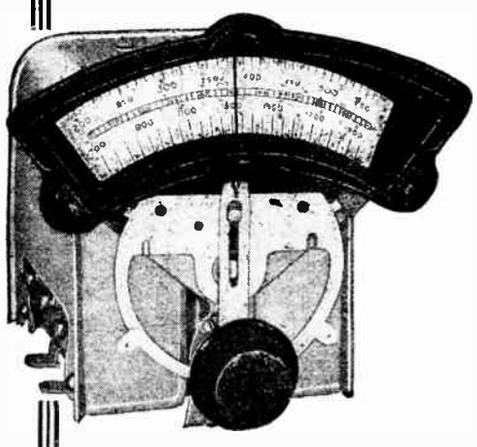
Whiteley Electrical Radio Co. Ltd., Dept. W, Radio Works, Mansfield, Notts.

SEND FOR NEW POLAR CATALOGUE

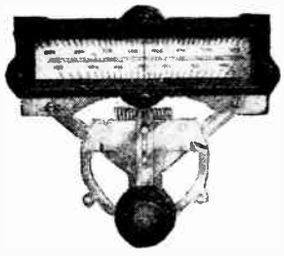
POLAR for SOUND DESIGN!

FAMOUS SINCE 1922

HIGHEST quality workmanship, accuracy and dependability have contributed to the unique position Polar hold to-day. The ever-increasing popularity has been further enhanced by the recent additions to the Polar Range.



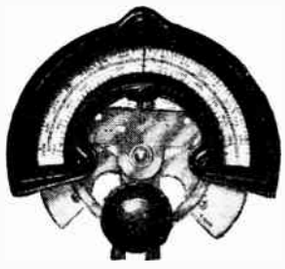
POLAR FULL-VISION & MOVING SCALE DRIVES



POLAR FULL-VISION "HORIZONTAL" DRIVE

Slow-motion drive. Scale in wavelengths and 0-100 degrees. Moulded escutcheon. Lampholder. Price **5/9**

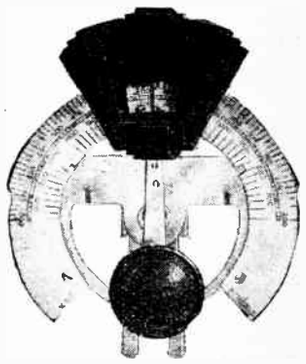
Fitted with air dielectric trimmer, as "Uniknob" design, 7/9.



POLAR "SEMI-CIRCULAR" DRIVE.

Slow-motion drive. Bevelled scale in wavelengths and 0-180 degrees. Moulded escutcheon. Lampholder. Price **5/9**

Fitted with air dielectric trimmer, as "Uniknob" design, 7/9.



POLAR "MOVING-SCALE" DRIVE

Slow-motion drive. Bevelled scale in wavelengths and degrees 0-180. Moulded escutcheon. Lampholder.

Fitted with air-dielectric trimmer, as 'Uniknob' design, 6/6. **4/6**

POLAR STAR MINOR THREE FOUR AND SUPER HET TYPES

Steel frame with cover. Trimmers operated from top. Sections matched within ½ per cent. or 1 mmfd. (whichever is the greater).

3 × ·0005 and Superhet - - - - **18/9**

4 × ·0005 and Superhet - - - - **25/-**

With full-vision "arcuate" (as shown), 'horizontal" or "semi-circular" drive, 5/9 extra, and for a further 2/- the drive can be fitted with air dielectric trimmer as "Uniknob" design.

Advertisements for "The Wireless World" are only accepted from firms we believe to be thoroughly reliable.

MISCELLANEOUS ADVERTISEMENTS

NOTICES.

THE CHARGE FOR ADVERTISEMENTS in these columns is

12 words or less, 3/- and 3d. for every additional word.

Each paragraph is charged separately and name and address must be counted.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions 5%; 26 consecutive, 10%; 52 consecutive, 15%.

ADVERTISEMENTS for these columns are accepted up to **FIRST POST** on **MONDAY MORNING** (previous to date of issue) at the Head Offices of "The Wireless World," Dorset House, Stamford Street, London. S.E.1, or on **SATURDAY MORNING** at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26B, Renfield Street, Glasgow, C.2.

Advertisements that arrive too late for a particular issue will automatically be inserted in the following issue unless accompanied by instructions to the contrary. All advertisements in this section must be strictly prepaid.

The proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Notes being untraceable if lost in transit should not be sent as remittances.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of private advertisers, letters may be addressed to numbers at "The Wireless World" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Wireless World." All replies should be addressed to the Box number shown in the advertisement, c/o "The Wireless World," Dorset House, Stamford Street, London, S.E.1. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

DEPOSIT SYSTEM.

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Wireless World," both parties are advised of its receipt.

The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50, 5/-. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1. and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.—Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

PILOT AUTHOR KITS

Exact to Specification

Peto-Scott are pioneers in Radio and Television. Our service to the British public was introduced in 1919, and during fourteen years of Solid Service and Satisfaction we have established a reputation for fair delivery that defies competition. Sets, Kits of all descriptions, Part Kits, Miscellaneous Components, Speakers, Eliminators, and Accessories. Purchases can be made for Cash, C.O.D., or on Easy Payments. Send list of your requirements for quotation by return.

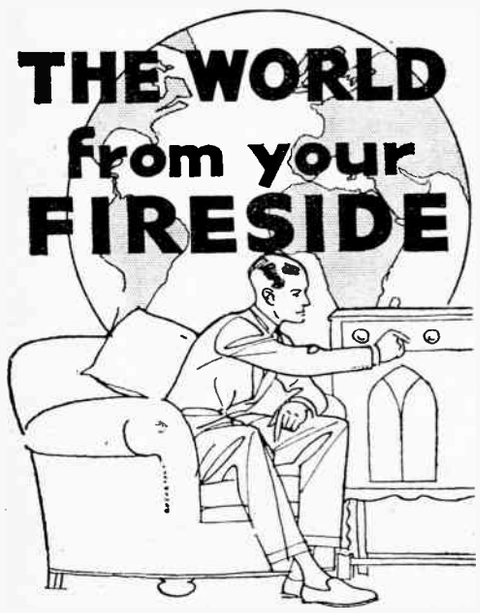
'Phone : National 1977.



WITH YOUR PRESENT SET!

Here is a wonderful instrument that will give you tremendous range with your receiver.

Short wave stations can be tuned in with most receivers when fitted with an "EELEX" Short Wave Convertor. Programmes from Australia, America and other distant countries are brought in without trouble even by those with little or no experience of Short wave reception.
You can spend many thrilling hours tuning in distant countries and your friends will be amazed at the remarkable increase in the range of your set.

Price 52s. 6d. (less valves). Send for Booklet No. C.46.

J. J. EASTICK & SONS, 118, Bunhill Row, London, E.C.1. 'Phones: Met. 0314 (6 lines).

Components, etc., for Sale.—Contd.

(This advertisement continued from previous page.)

ORMOND Condensers, 2-gang semi shielded, 2/6.

WESTERN ELECTRIC Mains Transformers, input 200-250 volt, output 500-0-500 volt, at 150 milliamps., 4v. 4a., 4v. 2.5a., 4v. 2a., 4v. 1a., 4v. 1a., massive job; 19/6.

T.C.C. Electrolytic Condensers, 100 volts working, 15 mfd.; 1/3.

SPECIAL Offer of Mains Transformers, manufactured by Philips, input 100-115v. or 200-250 v., output 180-0-180 volts, 40 m.a., 4v. 1a., and 4v. 3a., 4/6; 200-0-200v., 4v. 1a., 4v. 3a., 4/6.

ALL Premier Guaranteed Mains Transformers have engraved terminal strips with terminal connections, input 20-250 volts, 40-100 cycles, all windings paper interleaved.

PREMIER H.T.8 Transformer, 250v. 60 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 25/-.

T.C.C. 2,000+2,000 Electrolytic, 12 volts working; listed 27/6, at 10 -.

ROLA F5 P.M., 18/6; Rola F6 P.M., 22/6; Rola F7 P.M., 32/-; please state whether power or pentode transformer.

PREMIER H.T.9 Transformer, 300v. 60 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26/-.

PREMIER H.T.10 Transformer, 200v. 100 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26/-.

PREMIER Mains Transformer, output 135v. 80 m.a., for voltage doubling, 8/6; 4v. 3-4a. c.t. L.T., 2/- extra; Westinghouse rectifier for above, giving 180v. 30 m.a., 8/6.

PREMIER Mains Transformers, output 250-0-250 volts, 60 m.a., 4v. 1-2a., 4v. 2-3a., 4v. 3-4a. (all c.t.), with screened primary; 15/-.

PREMIER Mains Transformers, output 350-0-350 volts, 90 m.a., 4v. 3-5a., 4v. 2-3a. (both c.t.), with screened primary; 15/-.

PREMIER Mains Transformers, output 400-0-400 volts, 100 m.a., 4v. 4-5a., 4v. 2-3a., with screened primary; 15/-.

PREMIER Auto Transformers, 100-110/200-250 volts or vice versa, 60-watt, 7/9; 100-watt, 10/-.

SPECIAL Offer of Manufacturers' Type Transformers, any input, output 250-0-250 volts, 60 m.a., 4v. 1a., 4v. 3a. (both c.t.), 8/6; H.T.8 transformer, with 4v. 3-4a. (c.t.), 8/6; with rectifier, 18/6.

AMPLION Mains Transformers, input 100-250 volts, output 350-0-350 volts, 120 m.a., 4v. 5a., 4v. 2a., 6v. 1a. (all c.t.); 17/6.

FILAMENT Transformers, polished and engraved terminal boards, N.P. terminals, 4v. 3-4a., 5/-; 10v. 3a., 6/6; 12v. 1a., 5/-; 4v. 4-6a., 6/6; 14v. 4a., 6/6; 22v. 1a., 6/-; 6v. 2a., 5/-; 9v. 1a., 5/-; 35v. 3a., 15/-.

PREMIER Chokes, 40 m.a., 25 hys., 4/-; 65 m.a., 30 hys., 6/-; 150 m.a., 30 hys., 10/6.

PYE Chokes, 20 or 32 hys., 4/-; Premier multi-ratio output transformers, giving 15 different ratios, 7/6.

PREMIER Eliminators, input 200-250 volts, 40-100 cycles, A.C. incorporating Westinghouse metal rectifiers, output 250v. 60 m.a., S.G. and 120v taps, 42/6; with 4v. 4a. c.t. L.T., 7/6 extra.

BRITISH RADIOPHONE Wire Wound Potentiometers, with mains switch incorporated, 5,000 ohms, 10,000 ohms, 50,000 ohms, 100,000 ohms, 250,000 ohms, any value; 3/6.

PREMIER Eliminators, output 150v. at 30 m.a., S.G., and 100v. taps, with 4v. 3-4a. c.t. L.T., 37/6; or with trickle charger, 42/6.

PREMIER Eliminators, output 120v. at 20 m.a., S.G. and 100v. taps, 27/6; with L.T. trickle charger incorporated, 35/-.

PREMIER D.C. Eliminators, output 120v. at 20 m.a., S.G. and 100v. taps; 15/-.

ACCUMULATOR Chargers, 200-250 volts A.C., all incorporating Westinghouse metal rectifiers. 2, 4, and 6v. at ½ amp., 12/6; 2, 4, and 6v. at 1 amp., 17/6; 12v. 1a., 27/6; 6v. 2a., 35/-; 12v. 2a., 35/-; 12v. 1.5a., 30/-; 6v. 3a., 39/6; 30v. 1a., 42/6.

AMPLION High Inductance Chokes, resistance 2,500 ohms, 60 henries 60 m.a.; 5/6.

WESTINGHOUSE Metal Rectifiers: 120v. at 20 m.a., 6/6; 180v. at 30 m.a., 8/6; 8v. at ½ amp., 6/6; 6v. at 1 amp., 9/6.

KOLSTER BRANDES Electric Gramophone Motors, complete with turntables and automatic stop, 100-250v., A.C. and D.C.; list price £5, to clear £2.

B.T.H. Induction Type (A.C. only) Electric Gramophone Motors, 100-250v.; 30 - complete.

AMPLION Moving Coil Speakers, type E.M.644, dual fields, 2,500 and 5,000 ohms (100 and 200v.), with output transformer, 12/6; A.C. conversion kit for this speaker, 10/- extra.

WESTERN ELECTRIC Condensers, 250v. working, 1 mid. 6d., 2 mfd. 1/-; 500v. working, 1 mfd., 1/-.

T.C.C. Condensers, 250v. working, 4×4×1 mfd., 3/6; 6×4×2×2×2 mfd., 375v. working, 6/11; 4×4×1, 6/-.

SPECIAL Offer of Wire Wound Resistances.—4 watts, any value up to 10,000 ohms, 1/-; 8 watts, any value up to 15,000 ohms, 1/6; 15 watts, any value up to 50,000 ohms, 2/-; 25 watts, any value up to 50,000 ohms, 2/6; 50 watts, any value up to 50,000 ohms, 3/6.

WIRE Wound Potentiometers, 15,000 ohms, 1/6; Centralab Potentiometer volume controls, 50,000 ohms, 2/-; Colverstats, logarithmically wound Potentiometers, 6,000 ohms, 1/9.

FOR Callers only.—The following valves, guaranteed new :—

THE Last Few Western Electric 3211-D Valves, 10v. 3a. filament, 750-1,000v. plate, 50-65 m.a., impedance 3,500 ohms, amplification factor 12; cost £5, to clear at 15/-.

PHILIPS 328 Valves for L.T. Charging, 5/6; 329 Barreter lamps, 2/-

HARLEY Pick-ups, with arm and volume control; 12/6.

PREMIER SUPPLY STORES, 20-22, High St., Clapham, S.W.4. Macaulay 2188. Closed 1 o'clock Wednesdays, open to 9 o'clock Saturdays. Nearest Station, Clapham North Underground.

SECRETS OF CELESTION SUPREMACY

No. 2

Accurately Proportioned Magnets!

The cobalt steel magnets fitted to Celestion Speakers are ***accurately*** proportioned. The proportions are such that wasteful magnetic leakage is reduced to a minimum and the whole of the cobalt steel used to its fullest advantage. As a result, Celestion Speakers are much more efficient—are much more sensitive—than other speakers fitted with far larger magnets less accurately designed. It is such ***attention to detail*** that puts Celestion in the forefront of modern loudspeaker design. The name Celestion stands for high-quality reproduction combined with unfailing efficiency. Celestion speakers can be supplied to match any set or type or output. Ask your dealer to demonstrate, or write for illustrated details.

GOOD RECEPTION MEANS

RECEPTICON

INSULATED AERIAL CABLE

in the **ORANGE & BLUE CARTON**

"Recepticon" can be used either as an indoor or outdoor aerial or as an earth. It is a seven-strand insulated aerial cable drawn from pure electrolytic copper and protected with a weatherproof covering, and is definitely non-corrosive. The conductivity of the aerial is, of course, extremely high, so that when "Recepticon" is fitted perfect satisfaction is assured. *Obtainable from all Wireless dealers, or if in difficulty apply direct to the manufacturers.*

WATMEL

POTENTIOMETERS GIVE THE BEST CONTROL

It is obvious that if a firm concentrates on one type of component it is going to turn out a better job than a firm that dabbles in many. This year we are concentrating on potentiometers, and you may rest assured that when you purchase a Watmel potentiometer you are obtaining the very best from a firm that *specialises* in this type of component.

Here is illustrated the Watmel Type 1 Potentiometer.

Any resistance up to 50,000 ohms (Standarad Wiring).

Price **5/6**

With quick break Switch

Price **7/6**

Please write for free fully illustrated catalogue that will give you interesting information on Volume Control.

Special models made for manufacturers and for the Export Market. *Please write for further particulars.*

DICTIONARY of WIRELESS TECHNICAL TERMS

Compiled by S. O. Pearson, B.Sc., A.M.I.E.E., and issued in conjunction with "THE WIRELESS WORLD"

SECOND EDITION

Revised and brought up to date

THIS handy volume is very much more than a Dictionary. It not only takes the technical terms of wireless and explains their meaning, but in doing so it concentrates into a small space a large amount of information on wireless subjects. It has become, in fact, a compendium of current wireless knowledge, and an invaluable handbook for all who are interested in wireless transmission and reception. Diagrams and illustrations are freely interspersed throughout the book to amplify the explanations of the text.

272 pp., bound in cloth boards

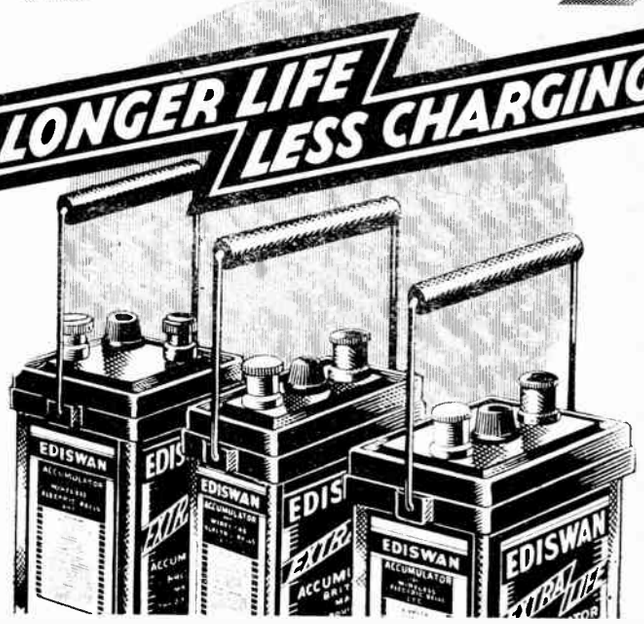
EDISWAN

The name that means 'EXCELLENCE'

LONGER LIFE LESS CHARGING



... the secret is

BALANCED CAPACITY

An accumulator with unbalanced plates is like a set with worn-out valves—just as inefficient. Ediswan accumulators are *balanced*. The positive and negative plates are designed to function in exact electrical balance, so that it is possible to charge them quicker and discharge them longer without the slightest risk of damage. A host of minor improvements, too, are incorporated in these Ediswan cells. Better from every point of view than ordinary cells, and no more expensive. Get an Ediswan to-day.

BURTON

CLASS "B" CONVERSION UNIT

This unit is intended to be added to existing battery sets in order that moving coil reproduction may be obtained. It contains a specially designed driver and output transformer, and the whole unit is housed in a highly polished brown bakelite case. The unit takes an average current of 6 m.a. and is capable of delivering 2 watts output without distortion

Made by C. F. & H. BURTON, Progress Works, WALSALL.

Is this a battery record? No— it's a

HIS PERTRIX BATTERY LASTED TWO YEARS

Dear Sirs, *11th February*, 1933.

It may interest you to learn that I have at present in use on a 3 valve wireless set a 120 volt Pertrix H.T. Battery, which I purchased in September, 1930. *This battery has now been in daily use for 2 years 5 months and still registers 65 volts. Is this a record life for a H.T. Battery?*

Yours faithfully, G. F., Lanark.

The above letter can be inspected at the offices of Britannia Batteries Ltd., 233 Shaftesbury Avenue, London, W.C.2

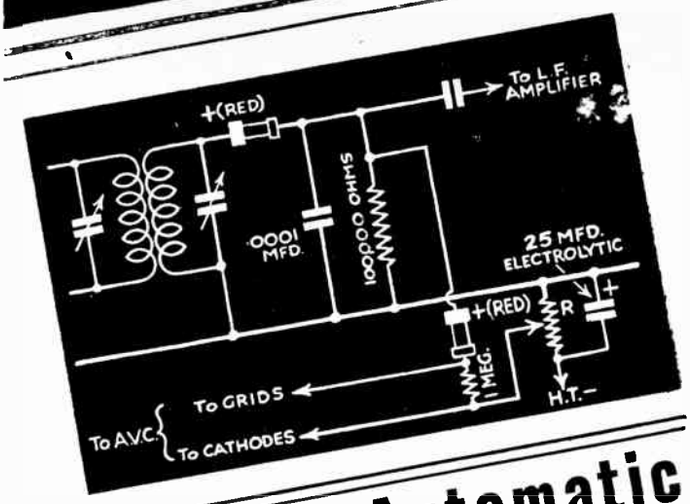
SAVE BY BUYING A PERTRIX

It's hard to say which is the record-holder. Scores of Pertrix users write to ask if theirs is the oldest working H.T. battery.

The reason for this Pertrix long life isn't an open secret—it's inside the battery. The only batteries in the world using a patent *neutral* electrolyte, Pertrix Batteries don't fall victims to corrosion. They don't eat their own insides out—and so there is no "shorting" between the cells, no clogging crystals. Your set can run morning, noon and night or be idle for weeks: it will make no difference to the long life of your Pertrix Battery. Pertrix Power does not leak away when the set is idle, it is stored up for the next time you want to listen. There's a Pertrix H.T. or G.B. to fit every set; the right battery in the right space. Pertrix also make Low Tension Accumulators that stand second to none.

FIT **PERTRIX** TRADE MARK *FOR GOOD*

British Made by BRITANNIA BATTERIES LTD., REDDITCH, WORCESTERSHIRE.



Delayed Automatic Volume Control

Up to the present, the introduction of Automatic Volume Control to receivers has necessitated complicated and costly alterations.

But by using a Westector, even Delayed Automatic Volume Control may be achieved in a simple and efficient manner.

By using the circuit shewn above, the Automatic Volume Control is inoperative on moderately weak signals, and only begins to function on signals of more than a certain pre-set value.

The particular value at which the control becomes operative is set by means of the potentiometer R.

Full details of A.V.C. and D.A.V.C. are given in "The All Metal Way, 1934."

The attached coupon and 3d. in stamps will bring you a copy.

COUPON

Please send me "The All Metal Way, 1934" for which I enclose 3d. in stamps.

The NEW "ATLAS" MAINS UNITS

CLARKE'S

NEW DESIGNS • INCREASED OUTPUTS • FOR "Q.P.P." & "CLASS B" • NO INCREASE IN PRICE

See them at MANCHESTER EXHIBITION. Stand No. 29.

ONLY "ATLAS" can improve on "ATLAS." It seems incredible that these world's finest Mains Units, the only Units to win the Olympia Ballots for two years in succession, could possibly be improved. But they have been—and without any increase in price!

New Cases—Re-designed Panels—Increased Outputs—Better smoothing and improved regulation. All the 25 m/A models are now suitable for "Q.P.P." and "Class B" amplification.

No wonder the new "ATLAS" Units are being specified by all the leading designers for their new season's Receivers. Follow the expert's advice and *insist* on "ATLAS." Ask for a demonstration to-day.

"All Radio Dealers have customers who wish for something different, something better, and there is profitable business to be obtained by using the Cabinets sold by C.A.C."
Scottish Radio Dealer, September, 1933.

"But for really ornate work, commend me to the C.A.C., whose cabinets touch the foremark of class."
The Nottingham Journal, 26th August, 1933.

Visitors to the Manchester Exhibition should not fail to inspect these beautiful models. The stand decorations include a magnificent

LANDSCAPE BY GAINSBOROUGH

valued at

£6,500

and considered to be one of the most outstanding examples of his work.

The "C.A.C." GRANDFATHER CLOCK RADIO-GRAM CABINET.

This handsome and original piece of furniture represents the very last word in Radio-Gramophone Cabinet design. Intended to house an electric clock movement, it has provision for fitting, if desired, a pair of dual compensated Loud Speakers. Ample provision is given below the Speaker Grille to accommodate almost any type of Receiver, whilst the electric Gramophone Motor and Pick-up fit into the sliding drawer below. The two side compartments allow for the storage of a very large number of records.

In Burr Walnut, Mahogany or Oak, **16 Guineas.**

The "C.A.C" COCKTAIL RADIO-GRAM CABINET.

This ultra-modern piece of furniture created immense interest at Radiolympia, where it was shown for the first time, and obtained for itself more press publicity than any other exhibit in the show. Provision is made for the accommodation of Combined Radio-Gramophone equipment, whilst on the left is fitted a spacious enclosed cupboard, admirably suited for a Cocktail Cabinet. Alternatively, it can be used as a storage compartment for Gramophone Records.

In Burr Walnut, Mahogany or Oak, **16 Guineas.**

Complete with "MONODIAL SUPER," Electric Clock, Garrard Automatic Record Changer, "Rola" Loud Speaker, Aerial tested and fully guaranteed,

Quotations for alternative Receivers on request.

Advt. of The General Electric Co. Ltd., Magnet House, Kingsway, London, W.C.2

The Sherlock Holmes of Radio.

MEET THE GREAT RADIO DETECTIVE...!

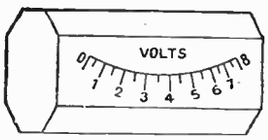
Radio's greatest boon! The Pifco ROTAMETER tracks down every radio trouble instantly. The octagonal knob on the Pifco ROTAMETER, with its eight different dials—"The Sign of Eight"—is the key to the instrument's simplicity and accuracy. The eight dials are shown here.

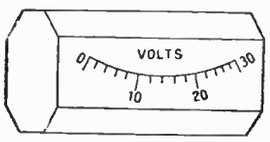
EIGHT SEPARATE METERS IN ONE

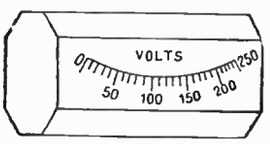
Radio testing is amazingly simple with the Pifco ROTAMETER. Just turn the octagonal knob according to the test desired and then connect the suspected component to the instrument. The needle gives its reading instantly on the dial. What could be simpler?

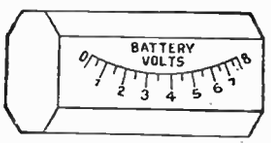
A BRITISH INVENTION—MADE IN ENGLAND

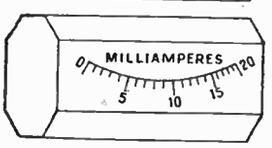
Ask your radio dealer to demonstrate the Pifco ROTAMETER to-day. If any difficulty, write direct to PIFCO LTD., High Street, MANCHESTER, or 150, Charing Cross Road, London, W.C.2.

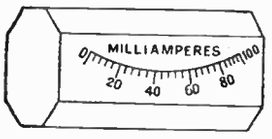


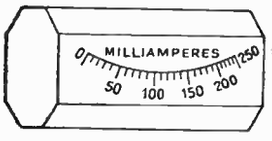


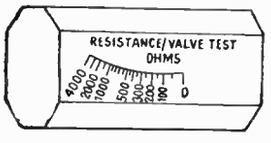












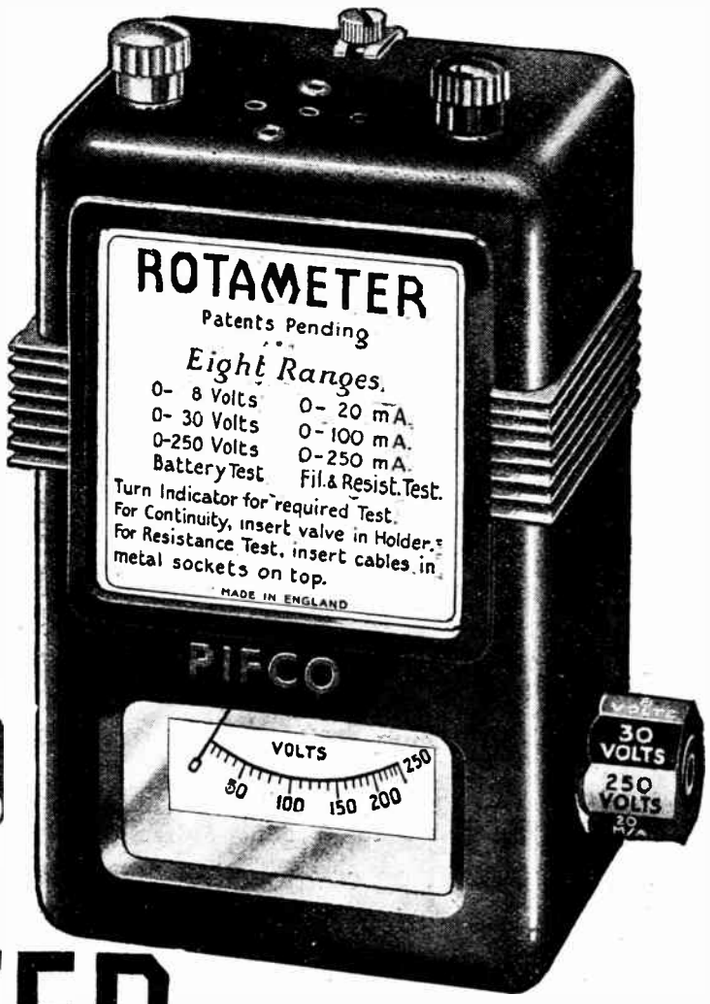
No instrument in the world makes all tests more easily than the Pifco Rotameter. Any component or circuit can be tested quickly and surely. Makes 100 tests.

RANGES:

1. *0-8 Volts. For low-tension voltage test.*
2. *0-30 Volts. For Grid-bias voltage test.*
3. *0-250 Volts For high-tension voltage test.*
4. *BATTERY TEST.*
5. *0-20 M.A. For individual valve test.*
6. *0-100 M.A.* — *For testing current taken by total valves in set.*
7. *0-250 M.A.* — *For testing current taken by total valves in set.*
8. *FILAMENT AND RESISTANCE TEST (4,000 ohms), for D.C. and rectified A.C.*

Finished in black bakelite case, complete with two 22-in. rubber-covered cables.

Dimensions: Height 4¾ in., width 3⅛ in., depth 1¼ in., weight 12 ozs.



Price 29/6

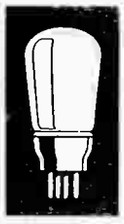
(1R)



Research goes on all the while in every radio valve laboratory, and every once in a while (but not nearly as often as you might suppose!), there is a real step forward in valve design or construction. But the real all-day and every-day problem of the valve maker is to achieve reliability! It is reliability that has brought Mazda right up to the top in the last three or four years. And it is because of reliability that Mazda will remain there.

MAZDA
THE SAFETY VALVE

Mazda Radio Valves are manufactured in Gt. Britain for The British Thomson-Houston Co. Ltd., London & Rugby

THE EDISON SWAN ELECTRIC CO. LTD., 155, CHARING CROSS ROAD, W.C.2.

Mention of "The Wireless World," when writing to advertisers, will ensure prompt attention.

Superhet Efficiency by Merely Changing Coils

MICRION

THE ONLY DUST IRON COIL with Adjustable Inductance

IMPEDANCE TUNING IS AN ENTIRELY NEW SYSTEM which makes the advent of the "MICRION" Coil a milestone in the progress of radio development; it is the outstanding achievement of 1933/34.

By substituting the "MICRION" Coil (or coils) for existing coils, your old set may be brought right up to date and given an almost unbelievable increase in selectivity & range.

PARTICULARLY DOES THIS APPLY TO CONSTRUCTORS WHO HAVE BUILT SETS WITH THE FAMOUS & POPULAR DUAL RANGE COIL which although in its day giving truly remarkable results, is now superseded by the "MICRION" Coil, that is designed for modern broadcasting conditions which now render older coils obsolete.

The "MICRION" Coil replaces all existing coils without alteration of the circuit, and thus renders old sets modern without costly and difficult alteration to the circuit and calibration.

The point to remember is that **this coil is being used by R.I. in all their mains and "Class B" sets.** It is the secret of the success of the 1933/34 "Madrigal" Receivers, which have already won such unstinted praise from the Wireless Press throughout this country.

SUPERHET PERFORMANCE FOR 12/6

List No. B.Y.36. Actual size 2¾ in. diameter, 3 in. high.

STAND No. 65 MANCHESTER EXHIBITION

R.I. LTD

"MICRION" Points of Superiority:

1. **"MICRION" is the only dust iron cored coil with a micrometer adjustment on both medium and long waves.**
2. **It can be used in any existing set without alteration of dial calibration.**
3. **It is the only coil of its type that gives such striking improvement of range and selectivity without demanding difficult structural alterations to the set.**

Bakelite Condensers

Last season Utility bakelite condensers were the best available, this year the new models are better still. They are sturdier, they are more accurate and we have improved on the previous low H.F. losses figure.

So whenever you require a bakelite condenser insist on a Utility model, the range includes all values from .00075 to .0001 and differentials from .0003 to .0001, a model for every purpose. The ordinary type can be supplied fitted with a standard Utility dial complete with baseboard mounting panel and escutcheon, as illustrated, for 4/6 complete. This combination gives you a complete tuning unit at an exceedingly low price.

Prices, including knobs:

W307	.00075	**2/6** each
W297/8/9	.0005/3/2	**2/-** each
W300	.001	**1/6** each

Write for a copy of our new catalogue, it contains full details of our complete range of condensers, dials, and switches.

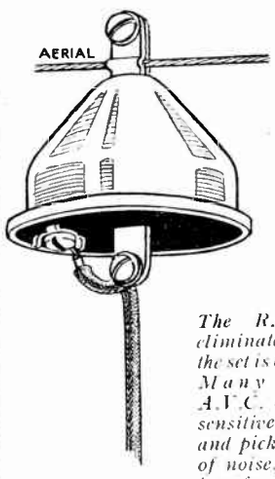
Sh—h stop all that noise!

The RADIOFORMER DEALS STERNLY WITH MAN-MADE STATIC



The greatest bugbear encountered in the quest for perfect wireless reception lies in the interference caused by neighbouring electrical apparatus. Prior to the appearance of the "RADIOFORMER" this nuisance could be cured only by action on the part of the owners of interfering appliances, but with the advent of the "RADIOFORMER" a new prospect opens before the set owner. Consisting of the Aerial and Set Radioformers, with 50 feet of shielded down lead, the kit will make a world of difference to the reception of any set on wavelengths from 15 to 550 metres, and with only the slightest weakening of the less powerful signals on the long waves.

The RADIOFORMER eliminates "static" when the set is tuned to a station. Many sets fitted with A.V.C. become extremely sensitive between stations, and pick up a great deal of noise. The so-called interference suppressors are fitted to reduce this noise between *stations whereas the RADIOFORMER reduces the noise which interferes with pure reception of a station.*

Knowledge of the working conditions of every part of a Radio circuit is essential to true Radio reproduction.

Such knowledge is useless unless based upon the findings of a reliable instrument; but every wireless man knows that the basis provided by a Ferranti meter is precise and reliable beyond all argument.

Here is the range of Ferranti Testers. There is a model for each and every requirement. They are the essential equipment of the Radio Engineer and Service Agent, and vital to the work of every serious experimenter.

British Standard Specification, First Grade Accuracy and Performance. No better instruments are available at any price.

UNIVERSAL VALVE TESTER

Resistance 1,000 ohms per volt.

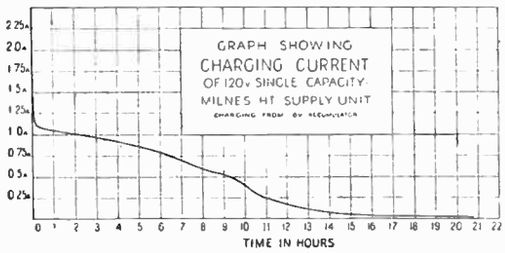
SPECIAL TROUBLE-FREE SWITCH MECHANISM
CHARGING TERMINALS
H.T. TAPPINGS SPECIAL CUPS PROVIDED
SOLID OAK CRATE
NICKEL-IRON CELLS - NO CORROSION
CHANGE-OVER SWITCH FOR CHARGING AND H.T. USE

gives 65-70% WATT-HOUR Efficiency

No other form of H.T. Supply of any type can show so high a degree of efficiency. The charge and discharge curves reproduced are illuminating and are typical of every Milnes Unit. Furthermore, this efficiency is maintained indefinitely. Year after year—for twenty years and more, the Milnes Unit will function with unfailing regularity and perfect consistency.



The Milnes Unit will serve the largest set. It will stand almost any rate of discharge. (Even dead shorting will not harm the nickel-cadmium plates). *Overnight the Milnes Unit regains its fully charged condition by drawing current from the L.T. accumulator*—automatically, without need for watching or timing and without wasting a milliamp of current. The constant voltage, steady flow and dead silent background make the Milnes Unit ideal for quality reproduction and short-wave work. It gives punch and dependability equal to the mains with the purity of a brand-new dry battery. The Milnes Unit is a sound engineering production—proved by 15,000 users over 5 years. It stands for a definite and permanent solution of all H.T. problems. Ask your radio dealer to demonstrate, or send the coupon to-day for free descriptive book.

From every point of view

the 'Alpha' *leads*

The R. & A. 'Alpha' Reproducer, to quote "The Wireless World," "is a distinct advance in the reliability of M.C. Units."

With ordinary speakers, chassis distortion or damage affects the diaphragm, and may cause the speech coil to foul the gap.

In the 'Alpha,' the unique and patented method of mounting the diaphragm independently of the chassis ensures complete freedom from the effects of chassis distortion.

Diaphragm and speech coil are mounted to a pressed steel member which is secured to the centre pole piece of the magnet by a single nut. Accurate centring of the speech coil in the gap is thus assured, resulting in permanent and trouble-free operation.

The 'Alpha' has a flux density of 9,000 lines per sq. cm. in the gap. This high sensitivity results in maximum power output with minimum input and the 6 ratio transformer permits accurate matching with the impedance of any super power or pentode valve.

2 Models

Two models are available, viz., STANDARD, with 6 ratio Transformer, and
MODEL "B," with Universal Transformer for Class B operation.

IGRANIC

The Igranic Variable "Megostat" High Resistance. Designed and constructed to the highest standards of radio engineering—finish in keeping with the reputation of Igranic—special contact preventing wear and ensuring constant resistance value—can be used as a volume or tone control, as a variable grid leak or as stabilising resistance, etc., in single-hole fixing—at the reduced price of **3/6** in four sizes—another example of that efficiency of performance and reasonableness in price which are typical of every item in the Igranic range. Let Igranic Components be the making of ***your*** set.

Send for fully illustrated Catalogue No. U.355.

R.F. SUPER-HET RADIOPAK

The only complete FACTORY MATCHED Super-Het Tuning Unit

THE unit comprises CONSTANT AERIAL COUPLING coil, R.F. inter-valve coil and oscillator coil, special super-het 3 ganged condenser, the oscillator tuning section having "shaped" tracking vanes ensuring matching over the whole wave-band. The R.F. Super Radiopak is matched within ½ of 1 per cent. before despatch. One has only to balance out the stray circuit capacities with the aid of the trimmers conveniently provided at the top of the Unit to ensure permanent MATCHED PERFECTION.

A PADDING CONDENSER is incorporated to balance the tuning on the LONG WAVE-BAND. SUITABLE FOR I.F. of 110 K.C. The scale is calibrated in *Wavelengths*. 200-550 m. 800-2,000 m. Type 535 c/w

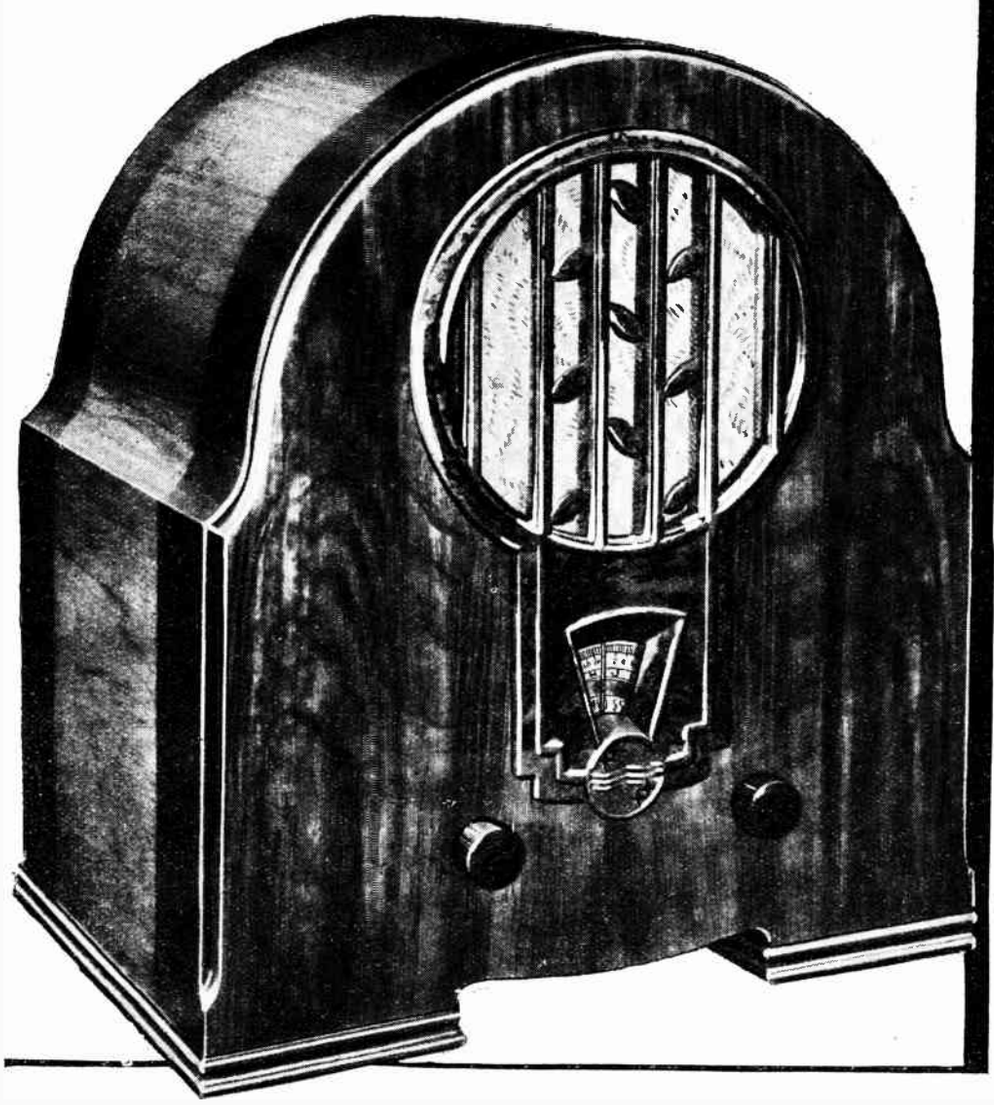
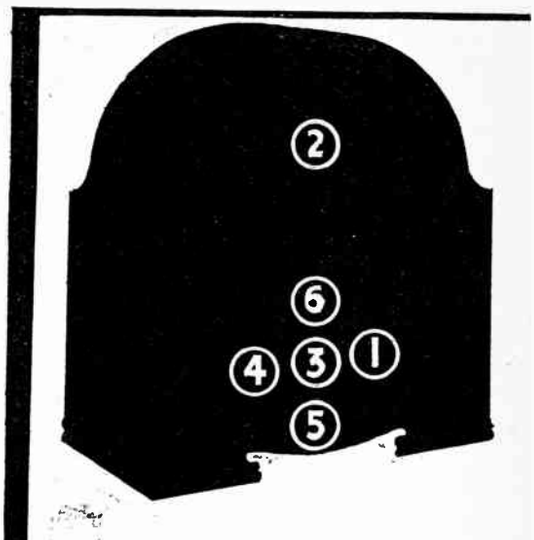
SUPERINDUCTANCE ALONE OFFERS ALL THESE FEATURES AT THIS LOW PRICE





1. Amazing sensitivity and selectivity. Four Superinductance tuned circuits. Precision methods of construction applied throughout the design.

2. Magnificent reproduction ensured by moving coil loudspeaker, carefully designed output stage and 3-position tone filter.

3. Simple 2-knob control. Absence of any oscillating circuit gives complete freedom from second channel and similar types of heterodyne whistles.

4. Automatic fading compensation and special selector control for quickly selecting the worthwhile programmes, and eliminating those spoilt by mush and background noise.

5. Easy station identification. Comprehensive station chart in conjunction with micrometer dial indicates the positions of nearly 100 stations with extreme accuracy.

6. The micrometer dial will not become obsolete when stations change their wavelengths. Revised charts will be supplied when necessary.

The Superinductance principle, designed by Philips for the reception of dual waveband broadcasting, has achieved its peak success in the new 634. The perfection of its all round performance, the simplicity of operation and the quality of its reproduction reach a standard hitherto unequalled by 7 or 8-valve sets of more conventional design.

For A.C. Mains. Type 634A.

100/260 volts 40/100 cycles. 2 S.G.H.F.-Diode Detector with S.G.L.F. Output Pentode. Valve Rectifier.

PRICE : 16 GNS.

or by 12 monthly payments of £1/11/- each.

For D.C. Mains. Type 634C.

110, 150, 200/260 volts. 2 S.G.H.F.-Diode Detector with S.G.L.F. 2 parallel Output Pentodes. Current regulator lamp.

PRICE : 17 GNS.

or by 12 monthly payments of £1/13/- each.

We claim that model 634C is the finest receiver ever produced for operation on D.C. mains regardless of cost.

EDITORIAL COMMENT

Station Identification

Why Not Call Signs?

A CORRESPONDENT, whose letter appears elsewhere in this issue, raises once more the question of station identification and suggests that, when the new wavelength changes come into operation in January of next year, an excellent opportunity presents itself to remedy the present inadequate methods of announcing the identity of stations. Our correspondent recommends the system of individual station calls, as adopted by the leading networks in America.

It has always been a matter of disappointment to us that our own stations, as well as those on the Continent, do not give satisfactory indications of their identity during transmissions. It is all very well to suggest, as has so often been done, that the wavelength of the transmissions should be a sufficient guide, but it is by no means easy to identify all the stations of Europe, and when the general reshuffle of wavelengths takes place under the recommendations of the Lucerne Plan, it will be some time before listeners are able to regain confidence in the exact identity of many of the transmitters. If this change of wavelengths were made the occasion for adopting call-signs to be given out at frequent intervals during the transmissions, identification troubles would be overcome. Individual countries could be allotted call-signs commencing with a particular letter to designate the country of origin as is done when general wireless communication call signs are allotted.

There are only two complications which we foresee might arise in connection with a call-sign for the purposes of identification; the first is that in many instances in Europe a number of stations broadcast the same programme and are controlled from a common microphone, and secondly, pronunciation of letter call-signs in different countries might be difficult to interpret. The difficulty in the case of relaying the same programme might be overcome by announcing the call-signs of all the various stations taking a common programme, and in the matter of pronunciation of call letters it would probably take very little time to recognise the differences.

If a system of call-signs of this nature is to be adopted, it should be considered without delay, in order that the system could be introduced throughout Europe at the time the reshuffle of wavelengths takes place.

Double-channel Transmission

Opportunity for an Experiment

THE suggestion has been put forward through our correspondence columns recently that the B.B.C. might consider the possibility of conducting double-channel transmissions from two separate broadcasting stations at times when these stations are both taking the same programme. This would necessitate, of course, a duplication of microphones in the studio and of the amplifiers and connecting links to the transmitting stations, and at the receiving end listeners would have to employ two independent receiving sets and loud speakers.

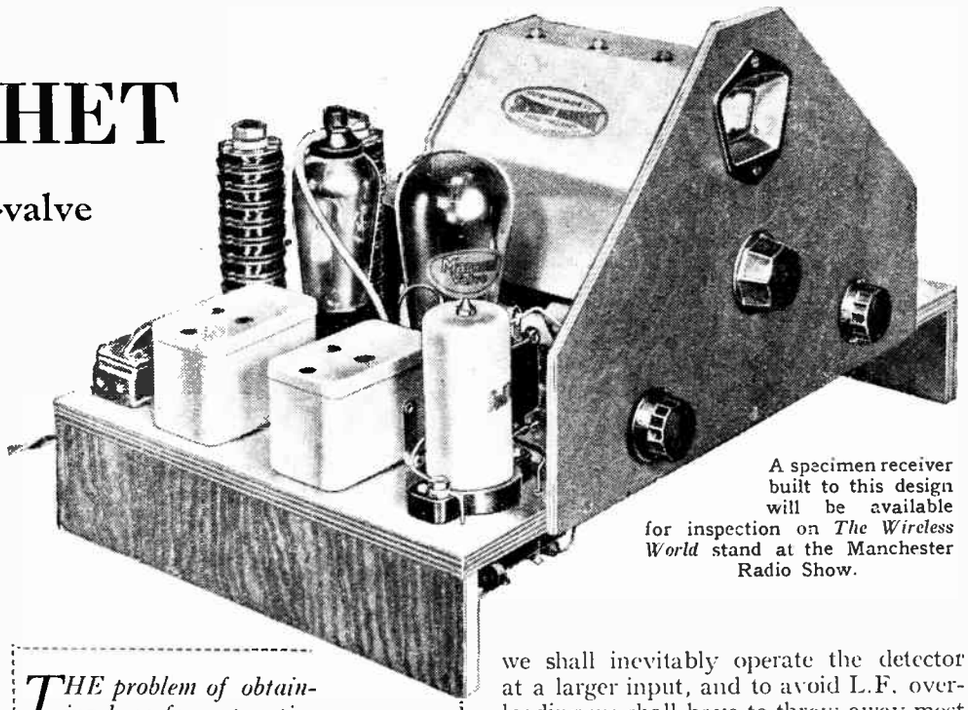
Reception under present conditions is, of course, only "one-eared," and it is not possible to obtain a stereophonic effect without a duplication of equipment. We believe that an enormous number of listeners would be prepared to set up two receivers for the purpose of testing out this experiment if the B.B.C. were prepared to do their part.

The Wireless World

D.C. SUPERHET

A Highly Selective Four-valve Receiver with A.V.C.

By W. T. COCKING



A specimen receiver built to this design will be available for inspection on *The Wireless World* stand at the Manchester Radio Show.

THE difficulties attendant upon the design of a D.C. mains receiver are considerably greater than those attached to the production of a set for alternating current supplies for two reasons: first, the voltage available is limited to that of the mains, and, secondly, complete isolation of the receiver circuits from the mains is not possible. The first of these is reflected in the choice of the output equipment and the A.V.C. system, while the second necessitates greater care in mechanical construction.

Practically speaking, we are limited to pentode type output valves with D.C. working, for the high bias voltage usually prohibits the use of triodes. Of the satisfactory automatic volume control systems we must usually choose the delayed diode type, for practically all others require a source of voltage additional to the H.T. supply. It was shown in a recent article[1] that the delayed diode A.V.C. circuit can only give satisfactory results if the delay voltage is large and the detector is operated at a correspondingly large signal input. At first sight there appears to be no alternative to using a duo-diode-triode type of second detector to give signal rectification, delayed A.V.C., and first-stage L.F. amplification. Even if the triode be resistance coupled to the output pentode, however, its amplification will not normally be less than about twenty times, and as a pentode only requires an input of the order of 10 volts, the triode input could not be greater than 0.5 volt if overloading were to be avoided. A delay of only 0.5 volt on the A.V.C. system, however, would not permit good control to be obtained, for the bias on the early stages has to be at least 10 volts on a strong signal. If we use a larger delay voltage, we shall inevitably operate the detector at a larger input, and to avoid L.F. overloading we shall have to throw away most of the amplification provided by the L.F. stage.

THE problem of obtaining hum-free operation and good automatic volume control is considerably greater in a receiver operated from D.C. mains than in one designed for working from an A.C. supply. These difficulties have been completely overcome in "The Wireless World" D.C. Superhet, and the receiver gives exceptionally good quality of reproduction with an entire absence of hum, while the A.V.C. system employed holds all stations at approximately constant volume and largely counteracts fading.

This is obviously uneconomical, and to avoid these difficulties in the present receiver no L.F. amplification is used between the detector and the output valve. The output pentode is operated with a grid bias of about 9 volts, and so requires a signal input of this value for maximum output. A duo-diode type of delayed A.V.C. system is used, the delay voltage being 9 volts, and being actually derived from the output valve bias. A.V.C., therefore, does not act until the detector input exceeds 9 volts, with which an L.F. output of very nearly 9 volts is obtained on deep modulation. With such a large detector input, rectification is truly linear and distortionless, and the A.V.C. action is extremely good.

The disadvantages of operating with such a large detector input are two: the pre-detector amplification must be unusually high for a given overall sensi-

[1] *The Wireless World*, September 8th, 1933.

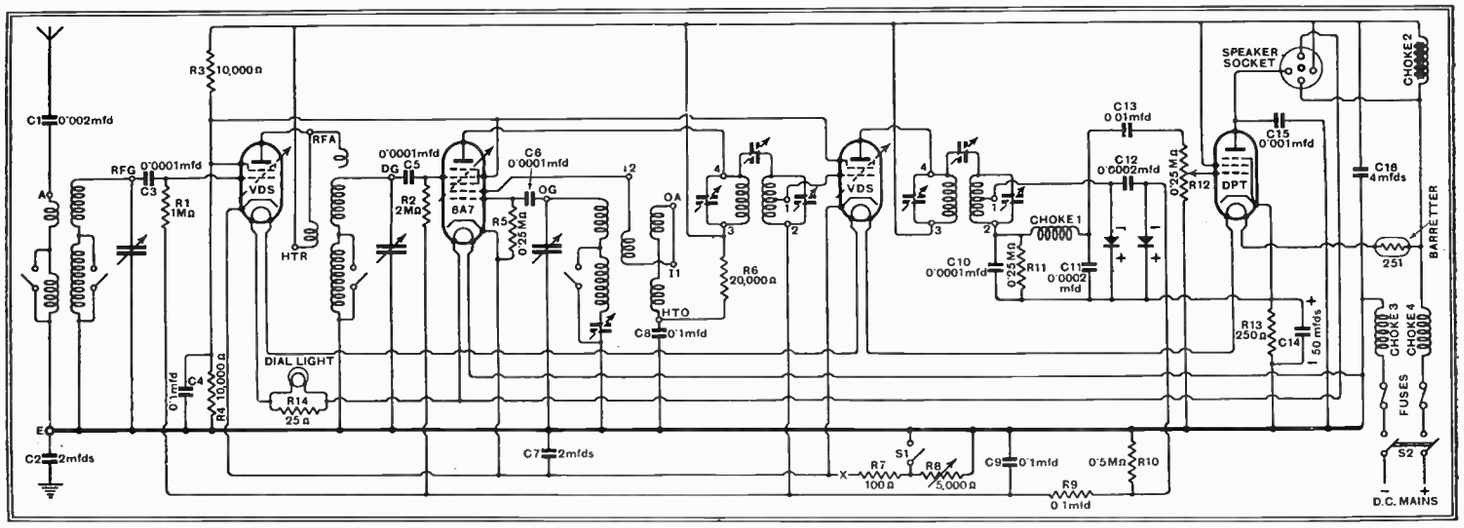


Fig. 1.—The complete circuit diagram of the new superheterodyne. The field winding of the speaker is connected across the "grid" and "plate" pins of the speaker socket and so provides additional heater current for the 6A7 valve.

"The Wireless World" D.C. Superhet—

tivity, and it is not possible to use the receiver with a gramophone pick-up, since the L.F. amplification is insufficient for adequate volume even with a sensitive pick-up. These points, however, are far outweighed by the advantages, for apart from the unusual freedom from detector distortion and the good A.V.C. system, there is a complete absence of hum under normal conditions owing to the small amount of L.F. amplification incorporated. To anyone with experience of the difficulties often encountered in the elimination of hum in a D.C. mains receiver, this alone would offer sufficient justification for the arrangement employed.

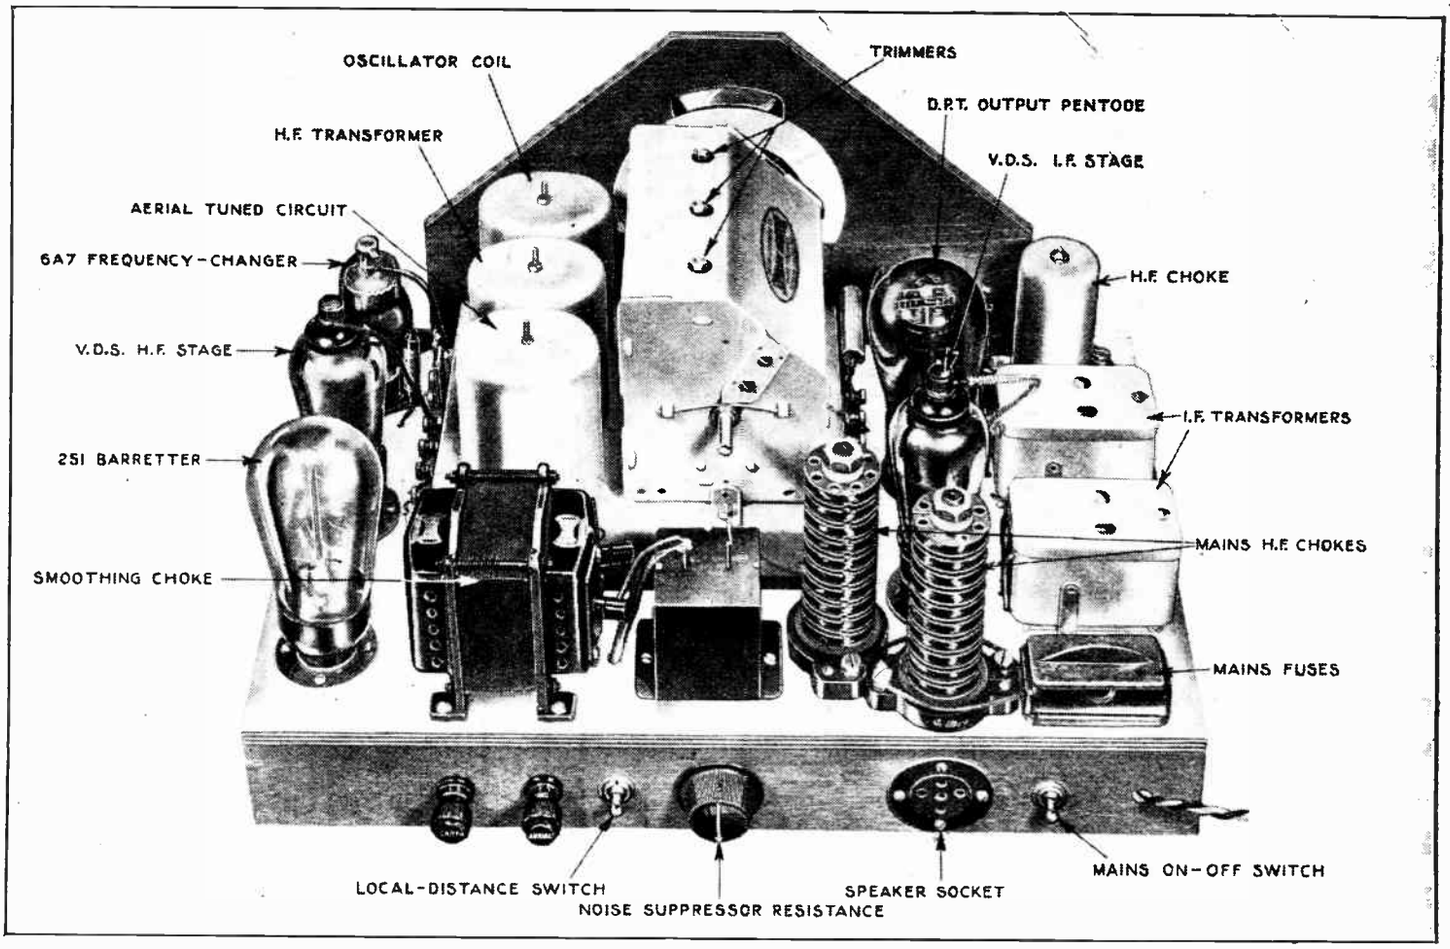
the tests, even with positive earthed mains.

After smoothing, the total H.T. supply is about 180 volts with 220 volts mains, and the full voltage is applied to the anode and screen of the output pentode, which is self-biased by the drop in the 250 ohms resistance R13, which is shunted by the 50 mfd. electrolytic condenser C14, the positive terminal of which is connected to the valve cathode.

The Use of Westectors

The duo-diode second detector actually consists of two Westectors. They are both fed from a tapping point on the secondary of the second I.F. transformer, one with respect to the earth line. The Westector anode, therefore, is biased 9 volts negatively, and rectification does not occur until the signal input exceeds 9 volts. The potential set up across R10 as the result of rectification is applied to the grids of the controlled valves through the filter R9 of 100,000 ohms and C9 of 0.1 mfd.

The I.F. stage employs a variable-mu valve coupled to the second detector through an iron-core type transformer, thus giving high selectivity and amplification. The component is of the band-pass type, permitting the retention of high audible frequencies, and the adjustment of the circuit coupling is carried out by a



A general view of the D.C. Superhet showing the chief components. The local-distance and mains switches are fitted at the rear as they require only occasional operation.

The circuit diagram of the complete receiver is shown in Fig. 1; a double-pole mains switch S2 is fitted to permit complete isolation of the chassis from the mains when the set is switched off. A fuse in each mains lead offers protection against short-circuits, and 10,000 mH. chokes Ch3 and Ch4 tend to isolate the receiver circuits from the mains so far as H.F. currents are concerned, and also tend to reduce L.F. interference from the supply. The current for the series-connected heaters is then tapped off, and that for the H.T. line passes through a single smoothing choke Ch2, which is followed by a 4 mfd. condenser C16. Tests showed that this modest equipment was sufficient to reduce hum to inaudibility during all

directly and the other through the 0.0002 mfd. condenser C12. The first provides signal rectification, and its circuit is completed through the load resistance R11 shunted by the 0.0001 mfd. condenser C10. The L.F. potentials developed across this load are applied through the filter circuit Ch1 and C11 of 0.0002 mfd. to the output valve, the grid condenser of which is given a value of 0.01 mfd. The 250,000 ohms tapered potentiometer R12 acts as the pentode grid leak and the manual volume control.

The 500,000 ohms load resistance R10 of the second rectifier is returned to the earth line, whereas the Westector itself is returned to the pentode cathode, which is 9 volts positive

small variable condenser. As the detector input impedance is fairly low, the secondary is tapped to give a step-down ratio, thus reducing detector damping.

The input to the I.F. stage is taken from the frequency changer through another identical transformer, also used with a tapped secondary, this time, however, to maintain stability. It is the usual practice to tap the primary of a transformer in cases where the coil efficiency is so high that stability cannot be maintained with the full winding in circuit. In the case of a transformer following a frequency changer, however, this practice is inadvisable, for the efficiency will suffer unless a low impedance load be placed on the frequency changer at the signal and

"The Wireless World" D.C. Superhet—

oscillator frequencies, and H.F. instability may occur if this load be inductive. A tapped primary leads to a fairly high load impedance at high frequencies, and gives an inductive load; it is, therefore, to be avoided. With modern high-resistance screen-grid valves the amplification obtainable is the same whether the tapping point be in the primary or secondary, and in this receiver, therefore, a tapped secondary has been adopted.

For the frequency changer the Pentagrid type valve has been chosen on account of its marked superiority over the conventional two-valve arrangement. The oscillator grid is self-biased by the grid current flow along the 250,000 ohms grid leak R5, the tuned circuit being fed through the 0.0001 mfd. condenser C6. The tuning condenser, which is of the shaped plate type, and coils employed in this set are obtained as a complete unit, which was designed originally for a two-valve frequency changer with cathode injection. A coupling coil is provided, therefore, in the oscillator section which is not required with the Pentagrid valve, since coupling then takes place by electronic action. The normal reaction turns, however, are insufficient to maintain reliable oscillation with the Pentagrid, since the unit is designed for an oscillator valve of higher mutual conductance. The spare coupling coil, therefore, is used in series with the reaction coil proper to give increased feed-back, and experiment shows it to be entirely satisfactory in this respect. The oscillator anode circuit is fed through the 20,000 ohms resistance R6 with a 0.1 mfd. condenser C8 as a by-pass to earth.

The H.F. Transformer

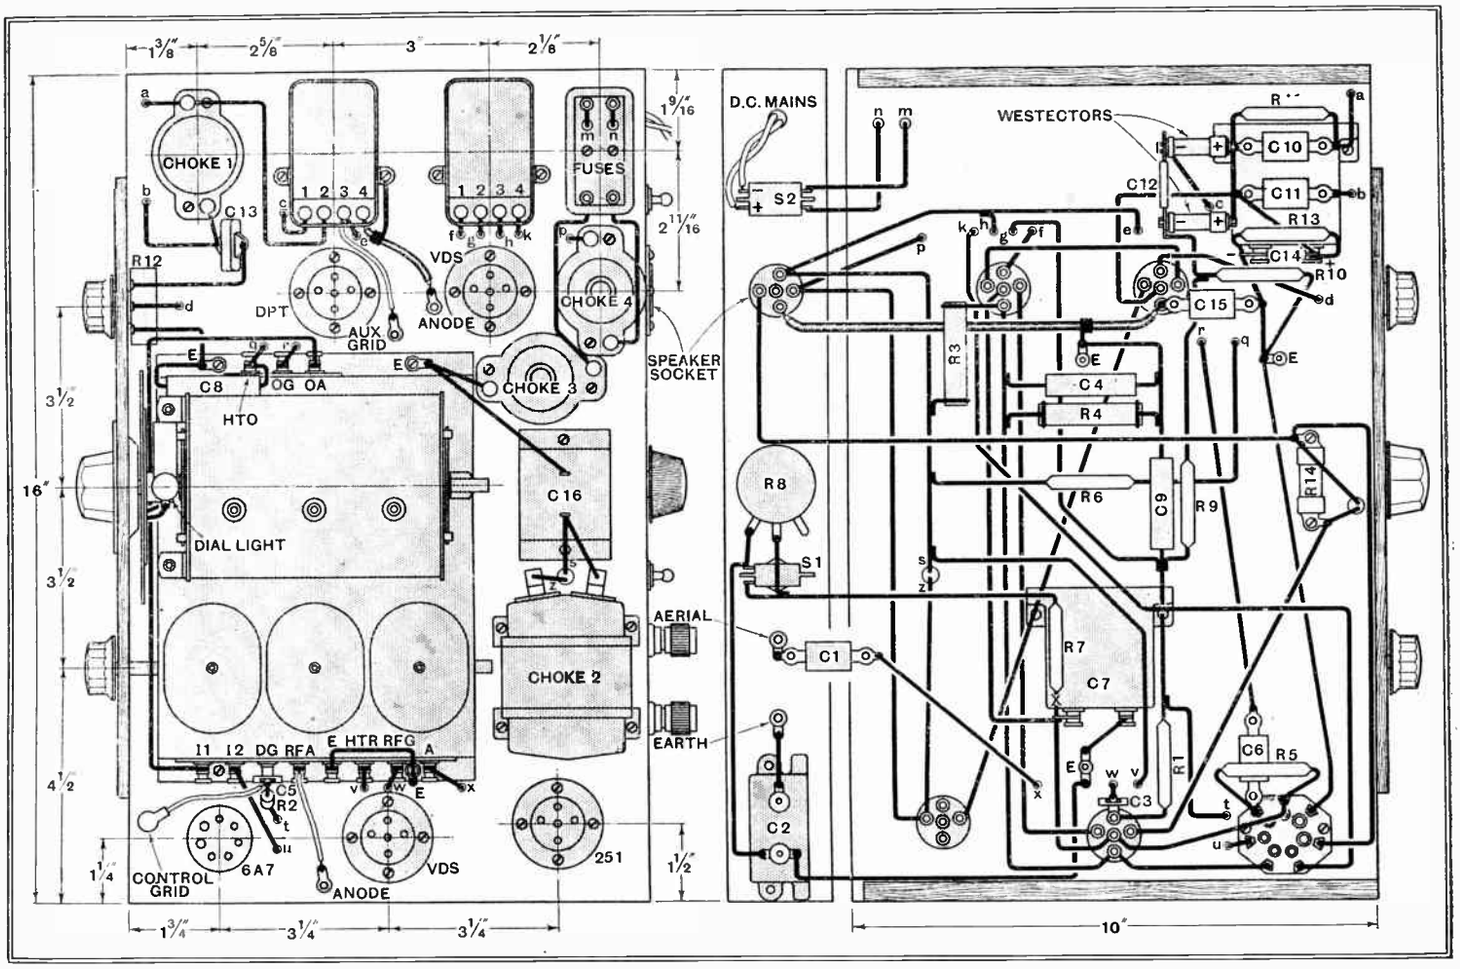
The variable-mu H.F. valve is coupled to the variable-mu tetrode section of the Pentagrid through an H.F. transformer of a type specially designed to maintain high efficiency at the low-frequency end of the medium waveband. The H.F. stage is preceded by a further tuned circuit, thus giving two signal frequency circuits to guard against second channel interference. A 0.002 mfd. condenser C1 and a 2-mfd. condenser C2 in the aerial and earth leads respectively are used as a protection against short-circuits.

The screen grids of the H.F., frequency changer, and I.F. stages are all fed from a common line derived from the junction of two 10,000 ohms resistances R3 and R4 across the H.T. supply; a by-pass condenser C4 of 0.1 mfd. maintains the screens effectively at earth potential to H.F. currents. The cathodes of these stages are also commoned, and, with the switch S1 closed, are taken to earth through the 100 ohms resistance R7, shunted by the 2-mfd. condenser C7, which provides the minimum bias. With the switch open, a variable resistance R8 of 5,000 ohms is connected in circuit for two purposes—to act as a noise suppressor and to assist the A.V.C. system in dealing with a very strong local station.

For use as a noise suppressor, the switch is opened, and with the set tuned to no signal the resistance is adjusted until the background of atmospherics and local interference is not excessive. Nothing louder than this pre-determined level will then be heard, and the process of tuning will be quiet. When a station has been tuned in the switch can be closed and the maximum sensitivity of the set is then available to counteract fading. For local reception it may be found that with the switch closed there is a certain amount of distortion, for the I.F. valve may be unable to provide the detector with sufficient input to give the requisite bias without being overloaded. The switch is opened for local reception, therefore, and the resistance adjusted nearly to the point at which a perceptible change in volume can be heard.

The H.F., I.F., and output valves are all of the type requiring 16 volts at 0.25 ampere for their heaters. No British D.C. mains type Pentagrid is yet available, however, and here an American valve, the 6A7, has been used. This is rated for 6.3

PRACTICAL WIRING DIAGRAM.



The clean layout and simplicity of the wiring are readily seen from these drawings.

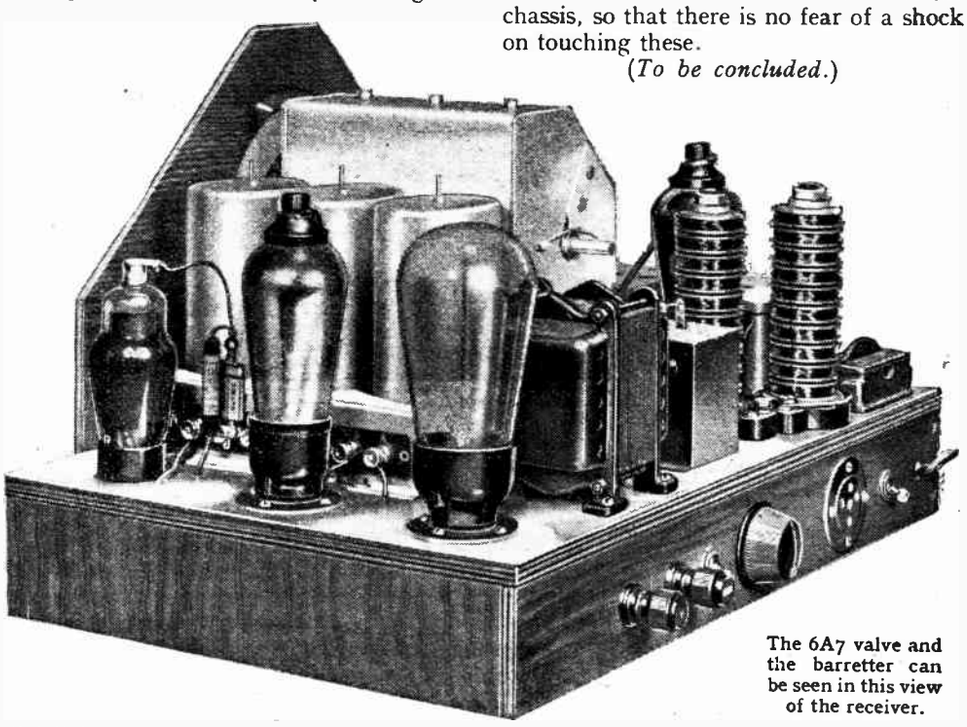
"The Wireless World" D.C. Superhet—

volts at 0.3 ampere, so that the heater connections are slightly more complicated than usual. The heaters of all valves and the 25 ohms resistance R14 shunting the dial light are all wired in series, with the 6A7 valve at the negative end of the chain. The positive end is then connected to the supply through the Osram 251 barretter, which maintains a constant current of 0.25 ampere through the whole circuit, irrespective of mains voltage variations between the usual limits of 200-250 volts. The British valves then all have their correct current, but the 6A7 current is low by 50 mA. This additional current, therefore, is passed through its heater by means of a 5,000 ohms resistance connected between the positive line and the positive side of the 6A7 heater. The Pentagrid thus receives its correct current of 0.3 ampere on 250 volts supplies, and about 0.29 ampere on 200 volts; since the lower current is sufficient to maintain an entirely satisfactory performance, the arrangement is simple and satisfactory.

The 5,000 ohms resistance used for this purpose will not be found as such on the circuit diagram, for the field of a moving-coil speaker is there shown as serving this purpose. In cases where a 5,000 ohms speaker field is not available, an alternative arrangement must be used, and the connections then required will be given in next week's issue.

The receiver is exceptionally easy to build, and no difficulty should be experienced, since the chassis is obtainable with the large holes ready drilled. When connecting up, care should be taken to preserve the correct polarity of the electrolytic condenser and of the Westectors. When using the set it must be remembered that the chassis of the set and all metal parts are in direct connection with the supply mains; if the positive of the mains be earthed, therefore, there is a risk of a shock on touching any metal part. It is advised, therefore, that the receiver be always operated in a cabinet, and that the grub screws in the control knobs be well countersunk. The switches mounted on the rear of the set are not connected to the chassis, so that there is no fear of a shock on touching these.

(To be concluded.)



The 6A7 valve and the barretter can be seen in this view of the receiver.

LIST OF PARTS

After the particular make of component used in the original model, suitable alternative products are given in some instances.

By-pass Condensers for 5-metre Work

Experimental Equipment Required for Comparative Measurements

THE performance of H.F. by-pass condensers on the ultra-short wavelengths has not hitherto received much attention, but as these very high frequencies are now coming more to the fore the results of some actual measurements made with several different sizes and types of condenser should prove of more than usual interest.

"WHEN is a condenser not a condenser?" The answer, "On 5 metres!" is more likely than not to be true. In fact, most things are quite different from what they are supposed to be at these short wavelengths. Which is the secret of their fascination, no doubt. It is splendid to be able to signal 200 miles on wavelengths that can't possibly travel more than about fifty.

But that is not our subject at this moment. Some time ago[1] Mr. Sowerby wrote an article showing how the inductance of a fixed condenser is important. The object of a fixed condenser—in the larger sizes, at any rate—is to provide a path of as low impedance as possible, in cases where an actual short-circuit is not permissible because of D.C. voltages. The greater the capacity of the condenser, the lower the impedance. But one cannot go on improving things by using larger and larger condensers, because beyond a certain point the inductance of the condenser, small though it is, sets a limit. The shorter the wavelength, the more serious is this restriction. Mr. Sowerby showed how the older type of 1 mfd. condenser reaches its minimum impedance at about 850 metres; below that it increases again. The "non-inductive" type, with a residual inductance of only about 0.02 microhenry, is better; its minimum is at about 270 metres, and it is still quite low at 100 metres, which was the lowest wavelength shown.

If even a "non-inductive" condenser is inductive below 270 metres, what about 5 metres! The condenser makers having done their best in reducing inductance to a minimum, we cannot turn to them for further help. With a view to providing some definite guidance on selection of condensers for 5-metre work, the following results are put forward. This particular wavelength has been singled out for attention because a good deal of interest has been devoted to it by amateurs. The figures to be given may, however, provide food for thought on ultra-short waves generally.

The title illustration shows the apparatus used for measuring impedance of condensers at 5 metres. The oscillator on the left is coupled through a one-turn coil, tuning condenser and fuse lamp to the "goal-post" inductance and condenser under test, the voltages across which are measured by the skeleton valve voltmeter on the right.

Before getting to the actual results, the method of obtaining them may be of some interest, as the problems met in devising it illustrate some of the delightful difficulties of 5-metre work.

If the same current is passed through two components, one known and the other unknown, the voltage across each is proportional to their impedances, so this provides a method for comparing them. The 5-metre current is easily obtained from an oscillator. The known impedance and the voltmeter are not quite so easy. As even an inch of wire has a large inductive impedance at this wavelength, there is not much hope of getting a standard resistance. And a condenser—well, that is our "unknown." So the only possible standard is an inductance. Fortunately, one

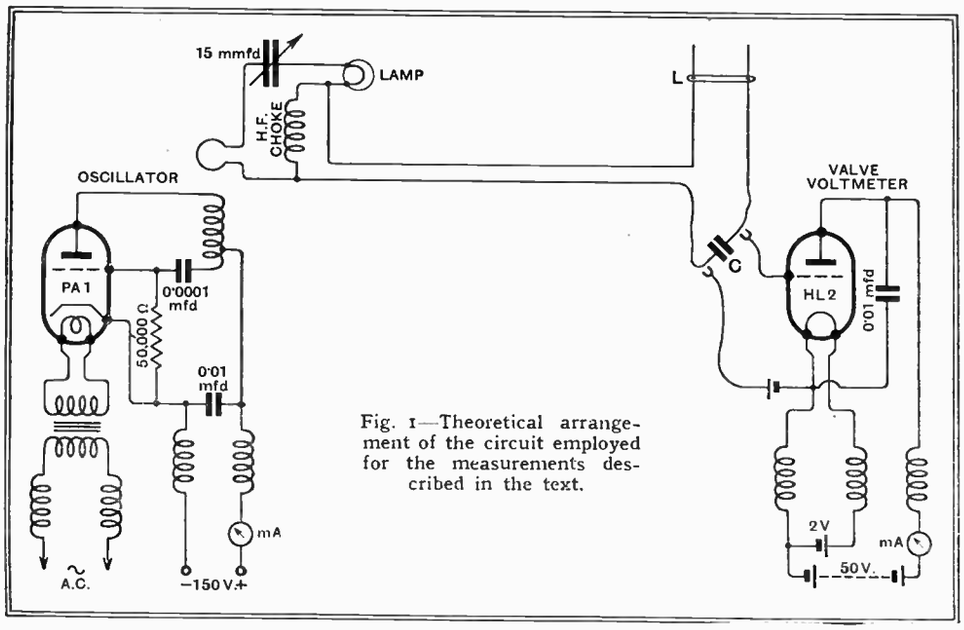

Fig. 1—Theoretical arrangement of the circuit employed for the measurements described in the text.

[1] *The Wireless World*, July 15th, 1932.

By-pass Condensers for 5-metre Work—

can calculate the inductance of regular geometrical circuits quite easily. The type found most convenient is like a miniature Rugby goal—two uprights and a cross-bar. The inductance is varied by moving the cross-bar up or down.

The voltmeter—obviously a valve voltmeter is the only hope—gave more trouble. However short the leads were made to it, some H.F. current *would* stray along them and produce almost as large a deflection with the grid-filament input short-circuited as when applied across an impedance in the intended circuit! Ultimately, sensible results were obtained with a specially rigged voltmeter as illustrated. The valve itself, a Mazda HL2, was suspended in mid-air, with no holder, and input clip leads cut down to about two inches, including a small grid cell picked for low resistance and wrenched out of its battery. The anode path was completed as shortly as possible by a 0.01 mfd. condenser.

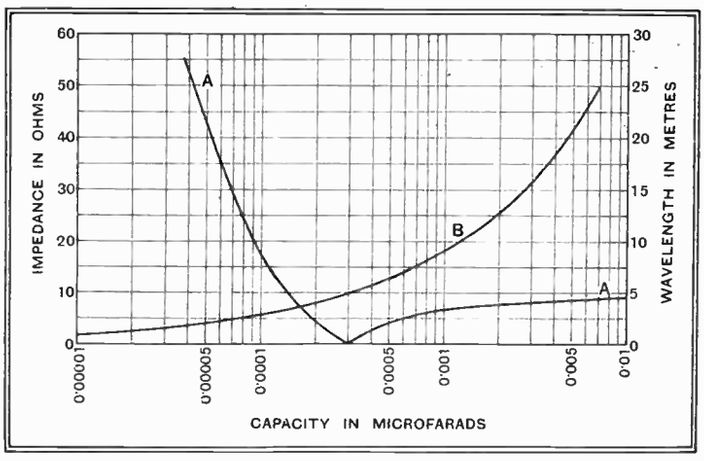

Fig. 2.—Curves showing how impedance of condensers varies with capacity and frequency. The optimum value for 5 metres can be obtained from curve A.

Circuit Described

This little assembly was isolated, so far as H.F. was concerned, by chokes in all the battery and meter leads—40 turns on a ½-inch former gives 7.5 microhenrys, which, assuming a self-capacity of 1 mmfd., forms a circuit roughly tuned to 5 metres, and therefore a very effective rejector. The grid-filament path was investigated and found to introduce negligible shunt loss on the components, viz., the goal-post inductance L, and the unknown condenser C (Fig. 1). Actually, L was about 1½in. high by ½in. apart, 18 S.W.G. wire. The rest of the circuit was separated about a foot by close parallel wires, to avoid direct pick-up from the oscillator. The H.F. choke was to provide a conducting path for the voltmeter when measuring C, and the tuning condenser to adjust the current, which is maintained constant by getting the little fuse lamp *just* visibly glowing. This is quite a sound and sensitive method when all others fail.

There is nothing very special about the oscillator. A high-slope PA1 valve was used because of its easy oscillation. Less than one turn was required for grid coupling.

The goal-posts were calculated to give an inductance of 0.034 microhenry—not very much, but 13 ohms at this wavelength!

The various types of condensers tested gave impedances as shown in the table.

The condenser consists of a capacity in series with a small unavoidable inductance, and what is measured is the resultant of both. The two work in opposite directions, and, as the capacity effect can be calculated, it is easy to arrive at the inductive contribution, which is shown in the last column.

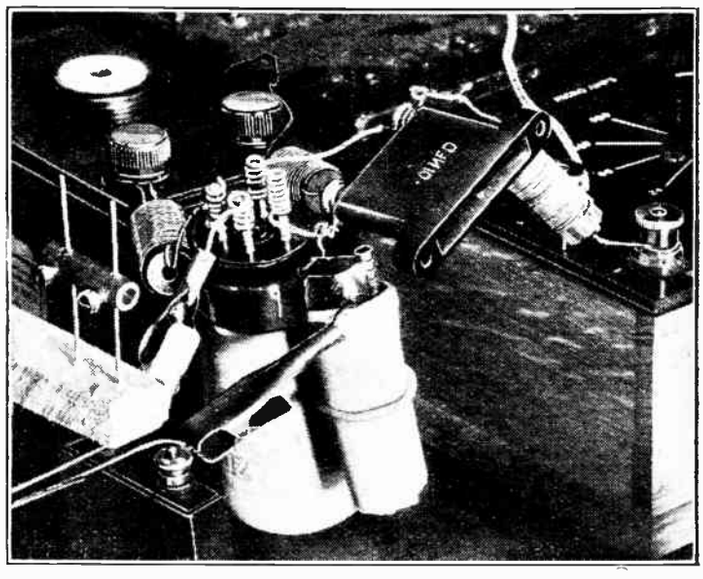
It will be noticed that there is a fairly considerable uniformity about these last figures. The two old inductive types are higher, but not enormously so. The others average about 9 ohms. Now 9 ohms is the inductive reactance of a piece of wire a little over an inch long. This is equal to the minimum distance from one terminal to the other, and therefore confirms the measurements. Incidentally, the inductance is 0.024 microhenry, which agrees very well with the figure given for "non-inductive" condensers.

But, you may say, surely the 1 mfd. condenser, with scores of turns of foil, should have a very much larger inductance? Well, it would have if the current took the trouble to go along all its tortuous convolutions. But it is much too rapidly oscillating for that, and finds the capacity of the first fold quite a good enough path, and the rest is just ignored. So the route taken, as the measurements show, is only about double the minimum distance between the terminals.

Thus a large condenser is in no case very bad. But, seeing that the inductive reactance cannot possibly be got lower than about 9 ohms, the only chance of improving matters is to choose such a capacity as just wipes it out—in other words, to employ a tuned acceptor circuit. The required capacity is 0.0003 mfd., and that this works out in practice is shown by the nearest example measured—the 0.00027 mfd., with only 1½ ohms.

Fig. 2 (curve A) shows how the impedance of condensers depends on the capacity, assuming 0.024 microhenry inductance in each case. The conclusion, then, is that the best value to choose for by-pass condensers in 5-metre circuits is 0.0003 mfd., assuming normal construction, which gives the inductance stated. Of course, the best value for other wavelengths is different; Fig. 2 (curve B) shows this.

It is not quite so important to get such a low-impedance path as would be necessary for a by-pass in sensitive medium or long-wave receivers, with amplification running into thousands, because such amplification is not attempted by direct means using ultra-short waves (and no wonder!). Nevertheless, it is useful to know definitely the best value instead of blindly thinking of a number; and so to reduce the many uncertainties of this work.



Specially rigged valve voltmeter for condenser measurements at 5 metres. The goalpost inductance is seen on the left.

MANCHESTER RADIO SHOW

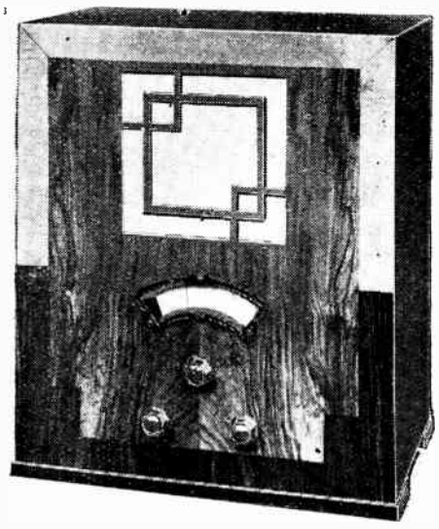
Sept. 27th to Oct. 7th.

11 a.m. to 10 p.m. Daily

THE tenth northern national Radio Show opened at the City Hall, Deansgate, Manchester, on September 27th, and promises to create records both in size and in public attendance. Manchester has been a radio centre since the very earliest days of broadcasting, and even before that was the home of an enthusiastic body of amateurs who played a considerable part in hastening the development of broadcasting in the early days.

Importance of the Northern Exhibition

THE Manchester Exhibition was in former years really a local show mainly supported by Northern manufacturers, but with the growth of broadcasting the position has changed somewhat, and to-day it is really in the nature of a duplicate of the Olympia Show held in London in August.



B.W. Distavox receiver (Berry and Wilson).

On this account our three special numbers dealing with the exhibits at Olympia, and dated August 11th, 18th and 25th, can really be taken as a guide to Manchester, since the majority of the stands are exhibiting the same sets and components. In fact, our Olympia Show numbers comprise a review not of any particular exhibition but of the new season's products in general.

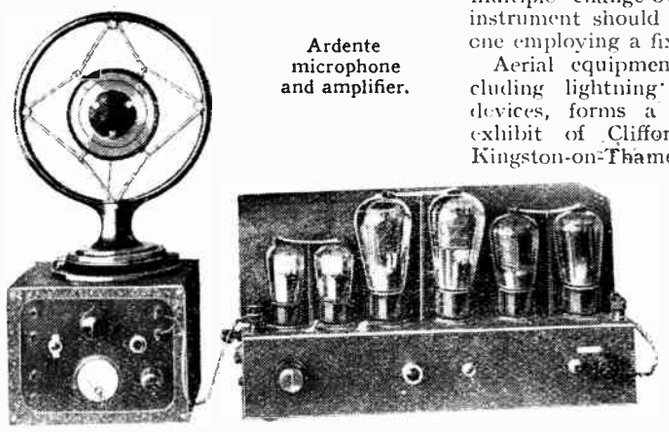
In the present article we propose, therefore, to confine our attention principally to the exhibits of those firms at Manchester which were not showing at Olympia, and to new products of other firms which have made their appearance since.

Visitors to Manchester will notice two outstanding features of this year's sets. First, sensitivity and selectivity have been greatly increased and the superheterodyne type of receiver is more in evidence than ever before. Interest in foreign-station reception must be taken to be the cause of this change. Secondly, the price of sets has reached a very low figure indeed, and yet without any apparent sacrifice in efficiency and quality. Undoubtedly sets and components of this season are an investment, for with the sets selectivity has been attained of an order which precludes the possibility of their becoming obsolete on this score. The number of foreign stations and their power already have reached a point when the problem of selectivity cannot become greater, so that as this season's sets are adequate in selectivity for present-day requirements they should remain equally serviceable in the future. Prices, we believe, could not be further reduced without a compromise with quality of reproduction, and since it would be suicidal for the manufacturers to cheapen sets at the expense of quality, no further reduction can be anticipated, but rather may we expect an increase in price in the future.

What the North is Doing

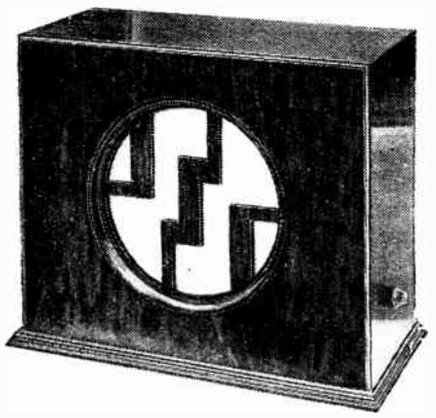
The local firm of Garnetts (Gresley) Radio did not exhibit at Olympia, and are now showing a series of sets manufactured in Salford. It will probably be agreed that their most interesting production is a five-valve (plus rectifier) mains-operated superheterodyne which embodies delayed amplified A.V.C. and has a total of seven tuned circuits. The chassis may be mounted either in a console or in a radio-gramophone cabinet. Other models include a Class "B" receiver and a similar radio-gramophone.

Berry & Wilson, another Northern firm, are showing a complete range of sets, both for battery and mains operation. Their "Distavox" model is a seven-stage set with two screened-grid H.F. pentodes and a double-diode-triode giving delayed A.V.C. Iron-cored tuning coils are employed in this receiver.



Ardente microphone and amplifier.

The firm of R. H. Dent, showing at Manchester, did not exhibit at Olympia. Amplifiers for cinema, church and public-address purposes are produced in addition to the well-known deaf-aid devices. It is interesting to note that an exceptionally compact deaf-aid amplifier which, complete with battery, microphone and earphone, weighs under 4 lb. is one of the latest models to be produced.



Wharfedale extension loud speaker with independent volume control.

Measuring instruments shown by Pifco have many points of novelty; probably the most attractive of the new products is the "Rotameter" Universal Meter, which covers eight separate ranges. The appropriate scale for each range is brought into position automatically by operation of the multiple change-over switch, and so the instrument should be simpler to read than one employing a fixed scale.

Aerial equipment of various kinds, including lightning arrestors and earthing devices, forms a prominent part of the exhibit of Clifford Pressland, Ltd., of Kingston-on-Thames, who is also showing an extremely low-priced dual-range screened tuning coil.

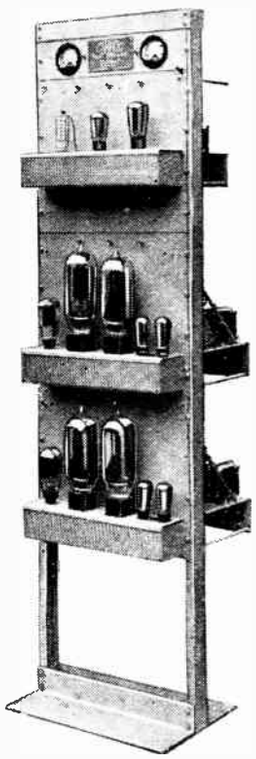
The series of permanent magnet moving-coil loud speakers made by Wharfedale Wireless Works, Bradford, has recently been supplemented by an extension model intended for adding to an existing receiver. This instrument is, of course, mounted in a cabinet and has the valuable feature of an independent volume control and on-off switch.

Manchester Radio Show—

The Star H.F.-Det. L.F. set employs pentode valves in all stages, and is offered at an extremely moderate price. The makers are also showing valves, batteries, and other components and accessories.

Although high-tension batteries form the principal "Universal" exhibit, several components, including dual-range coils and fixed condensers, are shown.

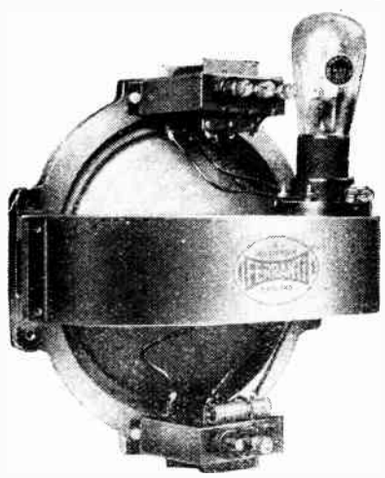
Battery charging equipment, which is mainly of interest to dealers and garages, is manufactured by Diggle, John Roberts, and the Small Power Dynamo Co.



Rack-built receiver-amplifier by Tannoy.

Although their programmes for the present season were described at length in our Olympia Show numbers, it is opportune to remind readers of the activities of several well-known local firms which are also exhibiting at Manchester. Of course, L.F. transformers of all conceivable types, including the latest designs for battery-economy circuits, figure prominently on the Ferranti stand. The new range of superheterodyne receivers makes a spectacular exhibit; space does not permit of a full description of these sets, but, as they include all the latest and most desirable features, such as automatic volume control, visual tuning, etc., the visitor should not miss an opportunity of examining them.

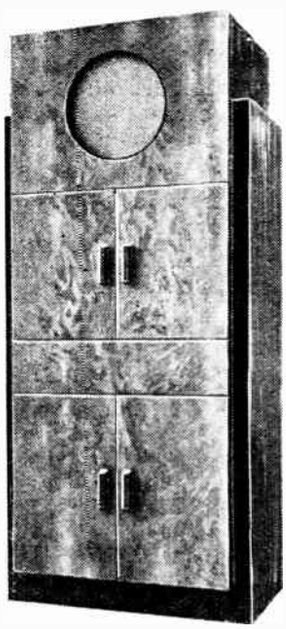
Clarke's Atlas have a very up-to-date range of sets for the present season, including an A.C. three-valve model with pentodes in all positions. Class "B" battery sets are also made, and the series of Atlas eliminators has now been supplemented by a new model intended for sets having Class "B" or similar output stages; the regulation of voltage output has been made specially constant for this purpose. Northern listeners now have an opportunity of examining the extremely attractive range of "Drummer" receivers made by the new firm of Edge Radio, Ltd., of Bolton. All types are represented, but as an example we may take the five-valve superheterodyne chassis, which is available in various forms of cabinet work, including a radio-gramophone with such refinements as automatic record changing and dual loud speakers. Adequate selectivity is assured by the provision of a total of seven tuned circuits, and delayed A.V.C. is included. An interesting new tendency brought about by the introduction of efficient battery economy circuits is illustrated by the production of an extremely ambitious battery-operated radio-gramophone with Class "B" amplification.



Ferranti Class "B" loud speaker unit.

As already stated, there have been few changes or additions in the programmes of the principal firms which exhibited at Olympia, but a few alterations are announced; for instance, the Ekco Model 74 superheterodyne chassis has been made available in a console model since the opening of the London Show. This chassis is well worth examining, as it includes many interesting circuit details, and is extremely well made in spite of its low price. It will be interesting to see how the North reacts to the modernistic black bakelite case, relieved with chromium insets, in which one of the models is housed.

The Dynatron "Ether Lord" radio-gramophone is now shown as a battery-fed set with Q.P.P. amplification. Here we have another illustration of the tendency to provide those who are forced to use batteries with the most ambitious and refined types of receiver. Improved "battery economy" circuits are, of course, responsible for this.



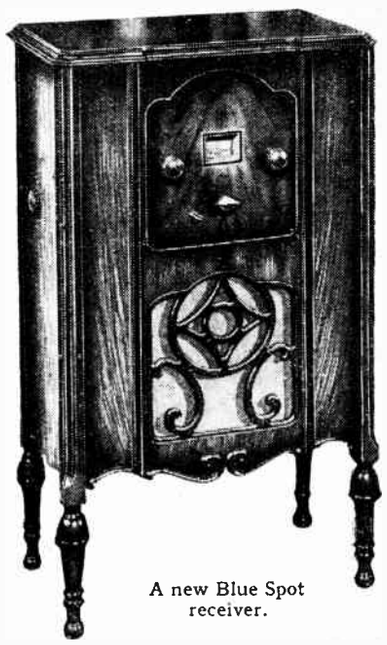
An example of modern cabinet work; the Dynatron receiver.

With regard to components, there have been few changes, but the firm of Graham Farish are now manufacturing a ganged version of the Zelos variable condenser, and a complete range of non-inductive fixed condensers as well.

Belling & Lee are making a feature of their Mains Disturbance Suppressor, which is designed in accordance with Post Office recommendations.

A few reminders as to other exhibits that should not be missed will not be out of place, in spite of the fact that they were described in our Olympia Show numbers. The larger G.E.C. superheterodyne merits attention, if only for the reason that it is one of the few to include a fully automatic system of "quiet" A.V.C.

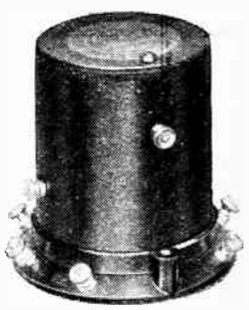
Each one of the many H.M.V. sets have points of interest, but attention will probably be focused on the "de luxe" model—the Superhet 10 Autoradiogram. McMichael are concentrating on "straight" sets as opposed to superheterodynes, and have several very interesting models, including one with built-in dual speakers.



A new Blue Spot receiver.

Unconventional cabinet work and radically new ideas in the housing of receivers are much in evidence this season. For example, the Climax "Casket" in which the loud speaker aperture is cut through the base, gives no visible indication that an up-to-date superheterodyne is mounted in the cabinet. A still more novel style of mounting is adopted by Ferranti for one of the superheterodyne sets, which is mounted in a low "bookcase" type of cabinet, with the controls most conveniently arranged so that the user can operate them while reclining in an armchair. Just the thing for the "tired business man" of whom we hear so much, and, seriously, an excellent idea.

The City Accumulator Company are also showing some highly original cabinet work, and, incidentally, are specialising in kits of parts for *Wireless World* receivers, in addition to sets of their own design. While on the subject of kits, it should be pointed out that the Cossor Melody Maker, on view in its latest form, is an extremely workmanlike job, and is available in several forms for both battery and mains operation. Lissen is also specialising in kits; one of the most interesting productions is an "all-wave" model (12-2,000 metres).



R.I. "Micrion" iron-cored tuning coil.

Among the new components, iron-cored coils as shown by Colvern, R.I., Varley, and Igranic will be examined with special interest, as will the new "plateless" Block batteries and the extraordinarily comprehensive range produced by Bulgin. In addition to the well-known Avometer multi-range measuring instrument, there is now a smaller model, with plug-and-socket change-over, known as the Avominor, which is sold at an extremely attractive price.

At the Bar

KING SOLOMON is reported to have said once in a burst of confidence that there were two things in life that got him down, and while I do not presume to attain to his eminence, either in the matter of wisdom or women, I must confess that to me one of the greatest mysteries of life is the manner in which the great superstition persists that Christmas and no other season is the proper time to buy a new wireless set. I mention this here since, in spite of my recent remarks upon the matter, this fact was forcibly brought home once more by an incident which—emulating the example set by Sir John Reith—I intend to inflict upon you whether you like it or not.

A friend of mine who is well known at the bar—not the alcoholic variety—recently approached me with the statement that as a result of a recent action in the high court concerning a wireless set, during which he had an opportunity of hearing it demonstrated, he had been so delighted with the musical reproduction that he had definitely decided to join the ever-growing ranks of the radiophiles. He wanted to know if, in my opinion, it was the most suitable instrument for him, and, if not, what did I advise? I told him that while the instrument was undoubtedly good, I thought he ought to hear one or two others before finally making up his mind, and volunteered to accompany him there and then to the showroom of a dealer who, I knew, always carried a varied stock, and who, moreover, possessed premises wherein customers could make their choice in real comfort.

Borrowing his own weapon of cross-examination.

To my amazement he demurred, saying that this was no time to buy a set, and he intended to wait until Christmas, which he alleged was the proper time to do it. Borrowing his own weapon of cross-examination, I soon elicited the fact that his opinion was solely based on hearsay from people as ill-informed in the matter as he himself proved to be. As a lawyer he should, of course, have known that what the soldier said is not evidence; but, seriously speaking, it occurred to me that if a man in his position, with a mind trained to form a sane and level-headed opinion upon almost anything under the sun, can fall into such an error, how much more so is the man in the street likely to go wrong. By dint of threats and cajolings I eventually got him along to the dealer's, and with my assistance he eventually chose a particular set which I'll warrant is not likely to be surpassed in performance for a long time to come.

Dropping a Brick

IT has caused me much pain and sorrow to read an ebullition from the pen of a well-known star who always twinkles brightly in the firmament of an old-established wireless company.

The cause of my distress and bewilderment is a statement to the effect that in one of their sets this old and honourable firm use a valve, to wit, a second detector, in which there are "three anode-to-cathode electron streams." Now it is not the number of the electron streams in this valve about which I am quibbling, but their nature.

Being born at the very peak of Victorian respectability, I was always very strictly brought up in the belief that no self-respecting valve ever allowed any electrons to chase each other along from the plate to the grid. It is painfully obvious to me, however, that I must be a back number from the point of view of valve technique, for I feel sure that the alternative theory, namely, that the writer in question has made an error, or to quote the language of the vulgar—dropped a brick—is quite untenable.

The Radio Roundabout

ONE feels almost dizzy at times at the number of revolutionary improvements that nowadays follow so hard on each other's heels in radio matters. "Revolutionary" is, I think, certainly the correct word to use with regard to some of them. I have in mind one in particular which a certain newspaper has just announced with great gusto. The "revolutionary" invention is a set which is operated by remote control. It struck me as somewhat strange, since a local firm put one on the market some years ago; what is stranger still, however, is that the firm which has just "invented" the set is the *same* one which marketed it several years ago. This "revolutionary" business is certainly designed to make your head whirl.

Caveat Emptor

ALTHOUGH I have been threatened with dire penalties, including that of being put on the spot, I intend here and now to draw attention to what I consider is a very great scandal, and that is the reprehensible practice of the B.B.C. giving free advertisements in the Press to all the butchers and bakers and candlestick makers whom they patronise; this is apt to be extremely misleading to the general public, who are accustomed to look up to the B.B.C. as the fountain of all knowledge.

Some years ago the B.B.C. adopted a certain make of gramophone pick-up which was peculiarly suited to their particular needs. Half-hearted attempts were made to conceal its identity, with the result

Half-hearted attempt to conceal its identity.

that the public's curiosity was piqued and eventually the secret was discovered. The upshot of the matter was that Mr. Everyman bought it, and found to his dismay that the volume obtained was far less on his set than that given him by the pick-up which he had discarded. The result was that the manufacturers of the device were unjustly blamed by the general public for selling them something which was not equal in every respect to that supplied to the B.B.C.

The above is, perhaps, an extreme case which I have deliberately chosen to illustrate what evils can result from the half-hearted concealment adopted by the B.B.C. All trouble could have been averted if they had taken thorough measures to conceal the identity of this particular component or, better still, have come out into the open and issued a frank statement explaining just why this particular pick-up, although suitable for their particular needs, was not necessarily suitable for attachment to the *average* set.

Since that date we have been regaled with the names of gramophone motors, pianos, furniture, and all manner of things chosen by the B.B.C. which very unfairly leads people to think that those of any other make are not worth considering.

MARCONIPHONE CO. LTD.,
RADIO HOUSE,
210-212 TOTTENHAM COURT ROAD,
LONDON, N.W.1,
for your copy of an interesting folder describing all the new Marconi Valves

B21

Marconi B21 brings better class B performance to all battery sets.

B21 differs from previous valves in several respects, the most important being that it operates with grid bias. This feature gives these important advantages:

1. ***Better quality, because the anode current cut-off is less sharp and the currents in the two halves overlap. This reduces spurious oscillation and gives less distortion at low output levels.***
2. ***Greater sensitivity, because the input impedance is higher and less power is needed from the driver valve.***
3. ***Greater overall magnification, because it is possible to use driver transformers having higher ratio than those allowable with the zero bias type of valve.***

In addition, Marconi B21 is built on exceptionally robust lines, the bulb being shaped to give a firm support to the top of the electrode system. Greater uniformity and stability are assured.

TEN TESTING INSTRUMENTS in ONE

40/-

NOTHING LESS WILL DO

DEFERRED TERMS if desired. Write for particulars.

THERE could be no surer conviction than that! . . . . that the AvoMinor, priced at only 40/-, is supremely ACCURATE! It means more than mere fault-finding, more than mere testing. It gives precisely measured evidence of radio faults and efficiency.

It measures TEN *different* ranges of milliamps, volts and ohms—affording testing facilities combined with positive accuracy which no other instrument at anywhere near its price can give. The AvoMinor is a self-contained moving coil combination measuring instrument with *a total resistance of 100,000 ohms. Full scale deflection is obtained with a consumption of only 3 milliamps.*

Make any comparison you like. This little brother of the world-famous Avometer does more, and more accurately, than any other combination testing instrument priced so modestly. Ask your radio dealer . . . he knows!

Be satisfied with nothing less. You will prefer the precision of the AvoMinor. Fully descriptive pamphlet post free.

The AVOMINOR TRADE MARK
TELLS THE WHOLE TRUTH!

Dimensions, 4" × 3" × 1¾". Complete in handsome case, with pair of leads and interchangeable crocodile clips and testing prods.

MORE FOR YOUR MONEY

YOU GET THIS FREE

50·2% LONGER LIFE

For every eleven shillings you pay for a Hi-Life battery you get 4/6 worth free — 50.2% longer life. This figure is the result of an impartial test by a famous British set-maker, a test that has proved that only the Hi-Life battery can give you this extra life. No other battery can equal this performance, no other manufacturer has the experience of more than 40 years battery manufacture.

The new Hi-Life batteries are the latest addition to the Hellesen range. They have set a new standard of battery performance and they sell at a price competitive with any other quality battery.

News of the Week

Current Events in Brief Review

Meeting of the U.I.R.

THE Union Internationale de Radiodiffusion will hold its next meeting from October 4th to October 13th in Amsterdam. A certain amount of importance will be attributed to this meeting as, no doubt, attempts will be made in Amsterdam to obtain the adhesion to the Lucerne Plan of the eight non-signatory countries. On the other hand it must be stressed that the U.I.R. is only an expert body and its decisions are by no means binding. But it may be easier to discuss matters in a semi-official manner than directly between postal administrations.

Bari Links Up With Rome

THE big telephone cable connecting Naples to Bari in the south of Italy has been completed, and as a result Bari has been connected with the South Italian group of stations since September 18th, receiving most of its programmes from Rome. The completion of this cable has been eagerly awaited by Italian broadcasters as, owing to the lack of suitable lines, most of the day's programme has hitherto to be provided in Bari itself, and this has proved very expensive.

Evening Lectures at the Borough Polytechnic

A SPECIAL course of twelve lectures and demonstrations on Loud Speakers and Acoustic Problems will be given by Dr. N. W. McLachlan, who is well known both as an authority on this subject and as a frequent contributor to our pages. The lectures, which range from loud speaker mechanism to transients and the general acoustic problems associated with speakers, are to be given on Mondays, at 6 p.m., at the Borough Polytechnic, Borough Road, S.E.1, beginning on October 2nd. The fee for the whole course is only 10s., and applications for particulars should be made to the Principal.

High Power Station in France

IN addition to the new P.T.T. station now in course of erection at Villebon-sur-Yvette, about 18 miles from Paris, work has begun on the 120 kW station at Thourie, 37 miles distant from Nantes, and it is expected that this station also will be transmitting in 1934.

Police Sets at Brighton

THE issue to the Brighton Police of pocket receivers with a calling device, such as were described in our issue for September 6th, 1932, has been the subject of a number of paragraphs in the provincial Press, and several writers to the lay papers appear to regard it as the precursor of two-way communication which, as we stated last week, is proposed for the warders at Sing Sing. It is doubtful, however, if such two-way working would be of much practical use. The system being tried at Brighton seems mainly applicable to urban areas where, presumably, any police officer receiving a call from headquarters can readily get on the telephone.

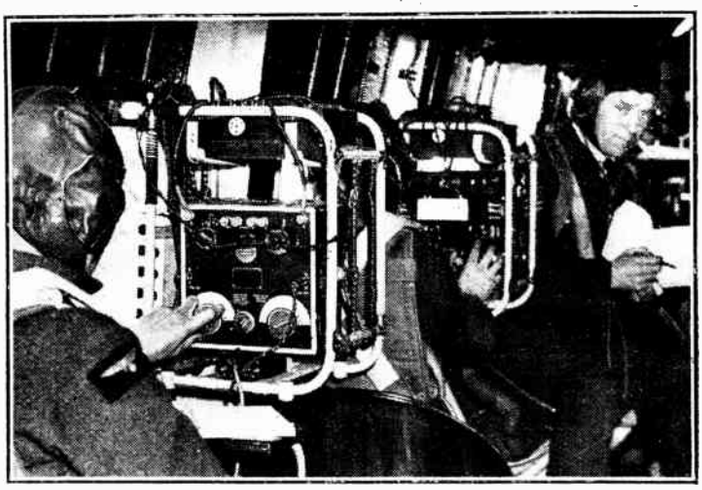
American Amateurs

ULTRA-SHORT wave working has taken a great hold on American amateurs, as is shown by the rapid increase in the number of amateur transmitting stations. In 1931 licensed amateur stations in the United States totalled 22,000. The figure now is 40,000, and, despite the depression, the Federal Radio Commission is receiving new applications for amateur stations at the rate of about 200 a week.

Japan Goes Ahead

ACCORDING to Tokio reports, Japan has made astounding radio progress in the last eighteen months. The total number of listeners now exceeds a million and a half, the Tokio region alone supplying more than 636,000. No fewer than nineteen broadcasting stations are in service, including the famous Joak, Tokio, and other high-power stations at Osaka, Nagoya, Hiroshima, Kumamoto, Sendai and Sapporo, each of which is well up to Western standards in technical design and studio construction.

In the meantime, the amateur transmitters are gaining strength and the Ministry of Communications has had to formulate new regulations to cope with them.



"HIGH-CLASS" RECEPTION. An aircraft cabin fitted as a classroom for the wireless instruction of R.A.F. pupils at the Electrical and Wireless School at Cranwell.

American Amateurs Again to the Rescue

DURING the violent hurricane which raged along the Atlantic Coastline of the United States at the end of August, amateur transmitters had a busy time re-establishing communication links with stricken areas in Maryland, Delaware, Virginia, Florida and Texas. In the neighbourhood of Salisbury, Maryland, power lines, telegraph and telephone lines were down, no trains or buses were running, and motor traffic was impossible.

A group of amateurs held a hurried conference and decided to move the station of Mr. E. L. Thompson (W3CQS) to the small section of the city where power was available. The erection of a new aerial in a fifty-mile gale was no easy matter, but eventually the little band of enthusiasts, standing ankle deep in water, managed to get into contact with W9CVW, Mr. J. Haggan, at Louisville, Kentucky. Emergency pleas for relief, Press messages, personal and official traffic flowed from the transmitter from the small hours of one morning till 5 p.m. on the following day, when normal telegraphic communication was resumed.

New Station for Poland

THE Polish authorities are contemplating the erection of a relatively high power station in the port of Gdynia. Our Berlin correspondent states that one object is to counteract, in the "Polish Corridor," the influence of the propaganda transmitted from the neighbouring station at Königsberg in Eastern Prussia.

Future Prospects in Ulster

THE Vice-Chairman of the Radio Manufacturers' Association, Mr. S. W. Cole, anticipates a very considerable expansion of the wireless industry in Northern Ireland when the new station for Belfast has been opened. At present it is estimated that only ten per cent. of the homes in the six counties possess a wireless set, but he envisages a time in the near future when there will be a radio in every other house and wireless manufacturers establishing works and helping to absorb local labour.

Swiss Broadcasting House

THE French-speaking cantons of Switzerland are to be provided with a new "radio house," the existing studios at Lausanne being inadequate for their present needs. A site has been purchased at La Salla, a suburb of Lausanne, where work on the building will soon start, and when opened, as is anticipated, in July, 1934, it will contain one large and two smaller studios with two rooms for talks.

New York Radio Exhibition

THE Wireless Exhibition which, until last year had been held annually since 1923 in Madison Square Garden, New York, has been revived this year, and forms a part of the National Electrical Exposition now being held in New York under the auspices of the National Electrical Manufacturers' Association.

Powerful South American Station

A NEW 37.5 kW. broadcasting station is projected for Buenos Aires, and the transmitter is now being constructed by the Telefunken Company. When complete this station will be the most powerful in South America.

Licence Expectations in France

IN a recent speech the French P.M.G., M. Laurent-Eynac, after outlining the progress of the new broadcasting service according to the "Ferrié plan" mentioned that, contrary to the expectations of sceptics, 1,400,000 declarations of sets had already been received, and it was hoped that the 1½ million mark would be passed before the end of the year. A minimum of 60 million francs would be brought in by the new taxes this year and the Government counted on 100 million next year.

Next Week's Special Number

HINTS AND TIPS BOOKLET

With next week's issue dated October 6th a special Supplement will be included in the form of a 32-page Booklet of practical HINTS AND TIPS specially compiled by the staff of *The Wireless World*. The full week's Foreign Programme Supplement will appear in a new form. A new Three-valve A.C. receiver with automatic volume control will also be announced in this issue.

The Electrostatic Loud Speaker

III.—Circuits for Operation with a Moving-coil Unit

By M. G. SCROGGIE, B.Sc., A.M.I.E.E.

IN this article the author concludes his review of the electrostatic loud speaker with an analysis of the operating conditions when using pentode output valves and gives practical hints on the best method of combining electrostatic and moving-coil units.

IT has been shown that when an electrostatic loud speaker is connected to a triode output valve there is a certain critical frequency below which the response falls off. The critical frequency is that which makes the reactance of the loud speaker (which being in effect a condenser is dependent on frequency) equal to OX (volts) divided by OY (amps) (Fig. 1) where Y is the lowest permissible anode current without serious bottom-bend rectification.

It is convenient to remember that this reactance is roughly equal to the optimum load for the valve. The critical frequency can be pushed lower to widen the effective response, but only at the expense of efficiency. So unless a very large output is available and used rather wastefully, it is better to obtain the bass response by means of a moving-coil loud speaker and to make the critical frequency quite high, say about 1,000 cycles per second. The table below may be useful.

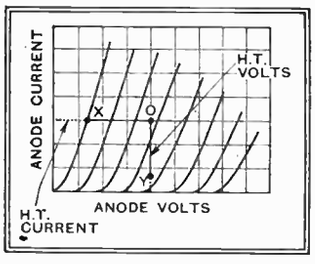


Fig. 1.—Critical reactance is given by OX in volts divided by OY in amps.

The capacity of the loud speaker is the actual capacity multiplied by the square of the output transformer ratio; a step-up giving a larger capacity and vice versa.

Fig. 2 shows a method of adding an electrostatic speaker to an existing triode and moving-coil (or inductor) speaker. The latter is likely to have a resonance somewhere about 2,000 or 3,000 cycles; and as this comes within the province of the electrostatic it is desirable to cut it out by inserting a choke L1, with an inductance of about one henry, preferably variable to allow of adjustment to suit the working conditions. If L1 is used, it is important to avoid any capacity across the transformer, or even excessive self-capacity, or there will be a series resonance and a worse state of affairs than ever. Another improvement is a variable

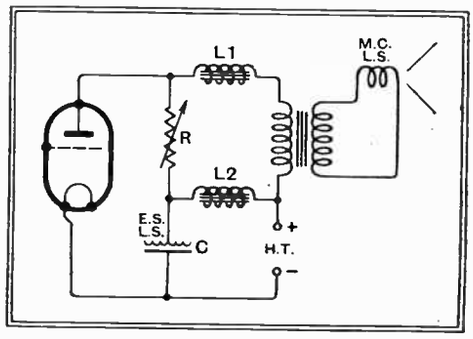

Fig. 2.—Practical circuit for combining the electrostatic with a moving-coil loud speaker following a triode output valve.

resistance R of about 10,000 ohms, which can be used to prevent the high-note overloading described last week. A further refinement, with the object of preventing large low-frequency voltages reaching the electrostatic speaker and causing it to rattle, is the choke L2, also tapped, with values up to 2 or 3 henrys.

The Pentode Valve

If R is in, the parallel resonance due to C and L2 may undesirably emphasise one frequency; if it is out, there may be both high- and low-note overloading. But as L2 is of value mainly in high-power stages, the overloading point is not likely to be reached; and, in any case, the danger of overloading can be minimised by stepping down, as shown in Fig. 3. Remember that stepping down tends to reduce the electrostatic low-note response, and vice versa, while excessively wrong ratio causes loss of volume too.

The case of the pentode is considerably different from that of the triode, and the situation is best explained while looking again at a valve load diagram (Fig. 4). Again we take the extreme and middle frequencies of 80, 800, and 8,000, giving with a loud speaker capacity of 0.02 mfd. reactances of 100,000, 10,000, and 1,000 ohms. Neglecting for the moment any complications due to the necessary coupling arrangement, these three conditions are again represented by the three ellipses. Here the lowest frequency ellipse develops across itself the maximum possible anode voltage, but unlike the triode it does so with a very small grid swing. Any larger grid swing would result in excessive voltages being developed, besides severe distortion.

The medium-frequency condition is similar to that of the triode in so far as the full grid swing results in full output voltage with just tolerable distortion. The load ellipse only just succeeds in fitting in. The highest frequency condition is also similar in that the anode voltage developed is very low, but full grid swing is possible at all the upper frequencies. Transferring these results to Fig. 5, it is seen that curve B, which shows the maximum voltage that can be developed across the speaker without overloading the valve, is practically the same as that for a triode. But the actual state of affairs is very

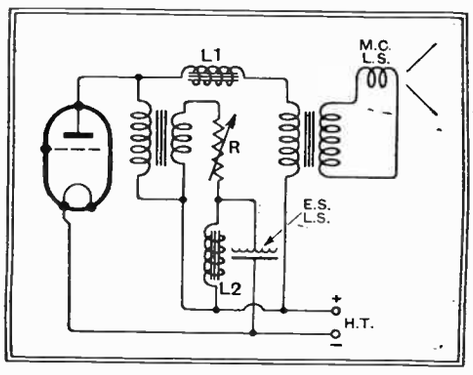

Fig. 3.—Modified arrangement of Fig. 2, with step-down transformer to minimise overloading.

different, for the output shown is on the assumption of maximum allowable grid swing, which as indicated by curve A is just the opposite to that of the triode. Moreover as in average broadcasting the actual distribution of grid swing over the frequency scale is very different from curve A, being greatest at low frequencies, curve B must be interpreted accordingly. If the grid swing were distributed according to the intensity given at the various frequencies during normal broadcasting,

Critical frequency.	Critical reactance of loud speaker in ohms.

1,500	1,650	2,600	4,400	6,600	13,000	26,000
2,000	1,250	2,000	3,300	5,000	10,000	20,000
3,000	830	1,300	2,200	3,300	6,600	13,000

The Electrostatic Loud Speaker—

the resulting curve B would slope off at the high frequency end very steeply indeed. A listening test confirms this by giving the rather surprising result that this type of loud speaker, noted for high-

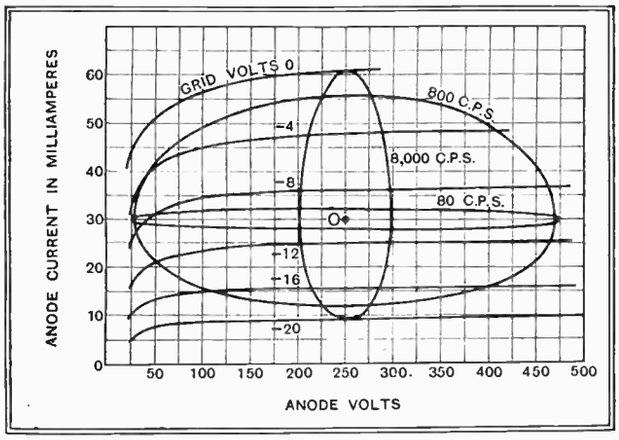

Fig. 4.—Load diagram for the electrostatic loud speaker in conjunction with a pentode output valve.

note response, is deficient in the same when run from a pentode.

At the lowest frequencies, however, there is a considerable divergence between theory and practice. It was explained in connection with the triode that some sort of coupling device is essential, and if this takes the form of a choke or a transformer, the loud speaker resonates with the inductance at some moderately low frequency. That causes little concern in the triode, for as long as the impedance in the anode circuit is *greater* than several times the valve impedance it makes little difference, and it is a *series* resonance, which causes the load impedance to become very small, which is to be guarded against. But in the pentode the output voltage increases almost without limit as the load impedance is raised, and the effect of a parallel resonance is to cause excessive emphasis of the resonant frequency, accompanied by severe overloading unless the volume is reduced so that all other frequencies are very feebly reproduced.

Practical Schemes

This serious objection can be counteracted by connecting a resistance in parallel with choke and loud speaker. If, for example, the resistance is 20,000 ohms, it

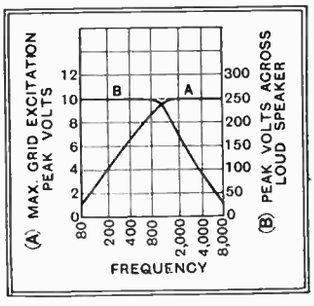

Fig. 5.—Operating conditions for a pentode derived from the curves of Fig. 4.

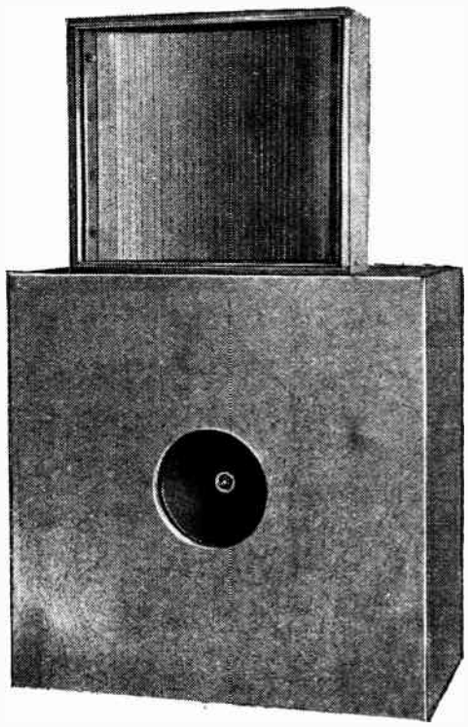
is obvious that the load can never *exceed* this figure, and so a limit is set to the voltage that can be developed, and a much more uniform response obtained, but somewhat at the expense of efficiency. Fortunately, the efficiency of the pentode drive starts off at a considerably higher maximum than that of the triode.

But the desirability of a dual loud speaker system is even more marked with the pentode, and so is the desirability of preventing the low-frequency voltages from being set up across the electrostatic loud speaker. This object can be achieved by shunting it with a relatively low inductance and also a resistance to prevent a sharp resonance. A fairly large condenser shunt across the moving-coil loud speaker completes the division of labour, and a resistance is necessary here also. All this sounds very complicated, but Fig. 6 shows how a single variable resistance can be made to serve not only as both shunting resistances but also as an effective tone control.

The ordinary transformer is used for the moving-coil loud speaker, and the upper frequencies are by-passed by the 0.1 mfd. condenser. The electrostatic loud speaker coupling choke may be 1 or



The combination of moving-coil and electrostatic units gives full bass response with unusually good reproduction of high frequencies and transients.

1.5 henrys on the primary side, and a secondary inductance to suit the size of loud speaker. The Varley 3H choke provides a variety of taps for obtaining the best balance. A 1 : 1 ratio is about right for a 0.01 mfd. speaker.

The tone-control potentiometer gives every tone from extreme low to extreme high preponderance.

Although any standard moving-coil loud speaker can be successfully used in a circuit of this type, it is, of course, preferable to use one specially intended for low-note reproduction. If there is no neces-

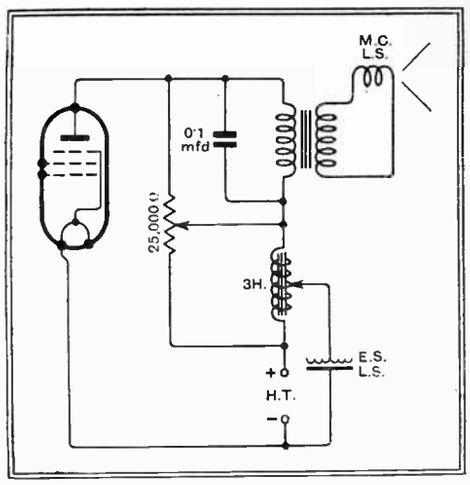


Fig. 6.—Dual loud speaker connections for a pentode output valve. The variable resistance provides tone control.

sity to look after the high volts, it is possible to do better justice to the bass by selection of suitable cone material and dimensions, and in other ways.

A simpler and less satisfactory circuit, but one which is more convenient to add to an existing receiver, and also gives some degree of tone control, is given in Fig. 7. It will be seen that in this the electrostatic loud speaker takes the place of the usual tone-compensating condenser, but, of course, it is essential that the H.T. voltage should come across it.

When applying to existing sets, it is important to see that any tone-compensating system that may be left in circuit is not preventing the electrostatic loud speaker from pulling its weight. In fact, the whole receiver, whether with triode or pentode output, must obviously be capable of pass the higher audible frequencies to the loud speaker if it is to reproduce them. This point needs to be stressed, because it is customary to cut high frequencies down fairly drastically in the interests of selectivity and freedom from mush, scratch,

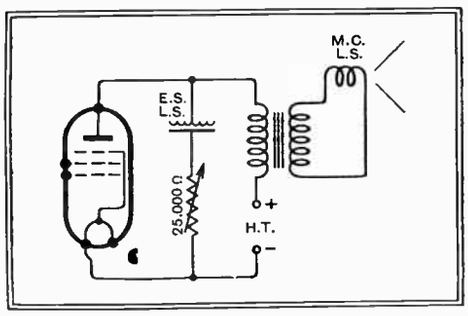

Fig. 7.—Simplified circuit for adding the electrostatic loud speaker to existing receivers. The loud speaker takes the place of the tone-correction condenser.

and hiss. The best plan is to restrict such limitation to one particular part of the circuit, where it can be controlled.

Where conditions permit—as when a station is being received at short range in relation to its power—the "top cut" can be removed and the advantages of the elec-

The Electrostatic Loud Speaker—

trostatic principle realised to the full. Attention should therefore be paid to by-pass condenser, anode filter chokes, grid "stopper" resistors, and other devices which tend to side-track the high tones.

It is a disputed point whether *phase* distortion is an important imperfection in reproduced sound. It is generally agreed that the ear is not sensitive to displacement of phase, such as occurs whenever a transformer coupling is used, in the case of sustained sounds like those of the flute or organ. This matter, being so extremely difficult to handle either theoretically or experimentally, seldom goes beyond vague references to "attack," yet it is undoubtedly of importance.

There seems little doubt that the electrostatic type of loud speaker is superior to any other in the reproduction of transients, but it hardly has a chance if there is considerable phase distortion in the preceding stages. The substitution of well-designed resistance coupling for transformers helps, but even if transformers are eliminated from the receiver there are likely to be several in circuit before ever the wave strikes the receiving aerial. Careful test has established, however, that the removal of even one transformer of several can be detected by a sensitive ear. So the point is one worth considering, and the electrostatic loud speaker is the most useful with which to consider it.

Distant Reception Notes

DETAILS of France's revised Ferrié Plan announced by M. Eynac in his speech at the Paris Wireless Exhibition are interesting, for they show that the Government has no intention of taking over any of the large privately owned stations which are already in existence. These stations will have apparently to come down to a maximum power output of 5 kilowatts and to work on common-wave channels. It seems rather a curious business, for some Government high-powered stations are being built quite close to the private ones.

One correspondent enquires why there is now nothing to be heard on the short waves before the time when reasonable men go to bed. I am afraid that I cannot say why *he* hears nothing, for there is certainly a great deal going on on most evenings. Zeesen, for instance, has five different transmissions, DJA, DJB, DJC, DJD, DJE, three of which are generally well received before midnight. DJC is a small hours station on 49.83 metres, but DJA on 31.38 metres starts operations at 11 p.m. DJD on 25.51 metres transmits from 4 p.m. until midnight, and DJB on 19.73 metres from 2 to 10.30 p.m. DJE on 16.89 metres has no regular times at present.

Other European short-wave transmissions worth attention are Rome, 2RO, on 25.4 metres, usually to be heard at good strength at any time during the evening. Radio Nations, Switzerland, HBP, on 38.47 metres, to be heard on Saturdays after 11 p.m., Madrid, EAQ, on 30 metres at work from 11 p.m., and Skamlebaek, Denmark, OXP, on 49.4 metres from 7 p.m.

Of American short-wave stations, W2XAD of Schenectady, works on 19.6 metres on Mondays, Wednesdays and Fridays from 9 to 10 p.m., W8XK, of Pittsburgh, transmits on 25.27 metres from 10.30 p.m. onwards, and W3XAL, of Boundbrook, is to be heard on 49.18 metres on Saturdays after 9.30 p.m. W2XAF, of Schenectady, on 31.48 metres does not come into operation until 1 a.m.

There is still occasional interference with Huizen (Hilversum programmes) from a Russian transmitter. Radio-Paris, Luxembourg, Kalundborg and Oslo are excellent on the long waves, and Motala is showing considerable improvement. Zeesen has been particularly good lately.

Lyons Doua has returned to splendid strength on the medium waveband, and Beromünster is coming in so well that it is frequently receivable in daylight. First-rate reception has also been obtained during the past week from Budapest, Munich, Vienna, the two Brussels stations, Prague, Langenberg, Rome, Katowice, Leipzig, Toulouse, Hamburg, Strasbourg, Milan, the Poste Parisien, Breslau, Bordeaux, Hilversum, Bratislava, Heilsburg, Turin, Hörby, Trieste and Nürnberg.

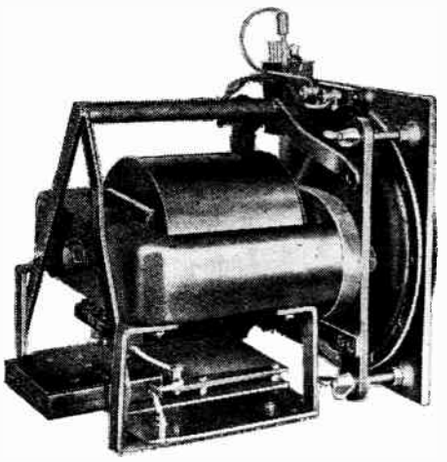
VOIGT LOUD SPEAKERS

Moving-coil Units of High Electro-Acoustic Efficiency

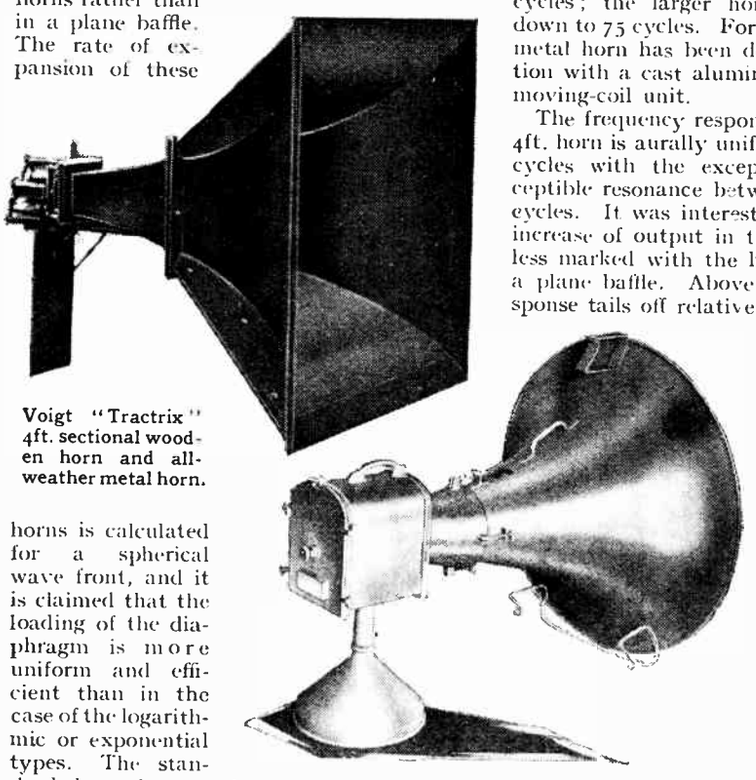
THE driving unit is of the moving-coil type with a 6in. cone diaphragm, and is remarkable for its exceptionally high efficiency. To obtain some estimate of the relative efficiency, the unit was first tested on a plane baffle, and it was found that for a given input the sound output was fully 5 db. above that of any unit we have so far tested. With the 4ft. horn a further increase of 3 db. was obtained.

The efficiency is largely attributable to the high flux density—according to N.P.L. tests, about 17,000 lines under working conditions. This has important consequences in other directions, for not only is the diaphragm damping increased, with consequent improvement in transient response and freedom to overloading due to excessive diaphragm displacement, but the usual rise in the impedance of the coil at high frequencies is prevented. Actually, the average impedance is between 30 and 35 ohms, and the impedance at 8,000 cycles is of the order of 50 ohms. Much better matching with the power valve is thus obtained over the frequency range.

The unit has been designed to work in conjunction with the Voigt "Tractrix" horns rather than in a plane baffle. The rate of expansion of these horns is calculated for a spherical wave front, and it is claimed that the loading of the diaphragm is more uniform and efficient than in the case of the logarithmic or exponential types. The standard horn has a 4ft. square mouth and is built up of wood sections which are readily dismantled for transport. It is intended for indoor use, and a smaller horn of the same type with a 2ft. mouth is available for use where space is limited. Naturally, the bass cut-off in the latter is higher, and was estimated aurally to be in the region of 110 cycles; the larger horn goes comfortably down to 75 cycles. For outdoor work a spun metal horn has been developed in conjunction with a cast aluminium housing for the moving-coil unit.



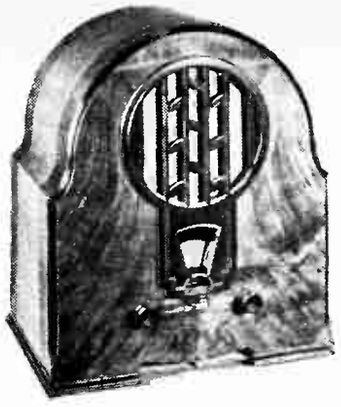
The Voigt moving-coil unit is provided with a field magnet giving 17,000 lines per sq. cm.



Voigt "Tractrix" 4ft. sectional wooden horn and all-weather metal horn.

The frequency response with the standard 4ft. horn is aurally uniform from 75 to 6,000 cycles with the exception of a just perceptible resonance between 3,500 and 4,000 cycles. It was interesting to note that the increase of output in this region was much less marked with the horn loading than on a plane baffle. Above 6,000 cycles the response tails off relative to the general level, but the response at 8,000 cycles is nevertheless higher than that of the majority of high-grade moving-coil loud speakers. The performance in general sets a very high standard of quality, both as regards balance and the reproduction of transients.

The makers are Voigt Patents, Ltd., The Courts, Silverdale, London, S.E.26, and the prices are as follow: Moving-coil unit, £14 10s.; 4ft. horn, £8; 2ft. horn, £4; all-metal horn and unit housing, £12 (provisional).



Philips "Superinductance" Receiver

MODEL 634A

FEATURES. ***Type.—Five-stage "straight" set with two tuned H.F. stages: designed for external aerial. Automatic volume control. Permanent magnet moving-coil loud speaker.*** ***Circuit.—Two tuned variable-mu H.F. stages preceded by band-pass filter—single diode tetrode detector-amplifier—pentode output valve. Full-wave valve rectifier.*** ***Controls.—(1) Combined tuning and waverange. (2) Combined volume control and sensitivity selector and mains switch.*** ***Price.—16 guineas.*** ***Makers.—Philips Lamps, Ltd., 145, Charing Cross Road, London, W.C.2.***

A "Straight" Set of High Selectivity and Long Range

THOSE responsible for the design of Philips receivers have always been consistent supporters of the "straight" set in which the amplification prior to detection is carried out at the frequency of the incoming signal. To meet modern requirements as regards range and selectivity in a receiver of this type calls for considerable knowledge in design and skill in construction, and the makers are to be congratulated on having solved the problem in a manner which has won unstinted praise from the adherents of rival systems of reception.

The success of the design is largely attributable to the efficiency of the tuning coils, which are Litz-wound on glass formers, and to the accuracy of alignment of the tuning condensers. There are four tuned circuits—two in the band-pass input circuit and one in each of the coupling transformers associated with the high-frequency amplifying valves. Detection is carried out by a single-diode S.G. valve which supplies the bias for automatic fading compensation to the first H.F. valve, and amplifies the L.F. component of the output before passing it through resistance coupling to the power valve.

To compensate for the variation in sensitivity between the top and bottom of the wavelength scale, the bias of both H.F. stages is varied by a wire-wound potentiometer ganged to the main tuning control. A further step in the sensitivity of the set as a whole is introduced by switching in or out a section of the bias resistance network. The manual volume control is situated between the diode and amplifier sections of the detector valve, and operates both on radio and gramophone reproduction.

It is interesting to observe that the smoothing of the H.T. supply is accomplished by resistance-capacity circuits, without the aid of iron-cored chokes or even of a loud speaker field winding. The method is successful, as the mains hum is inaudible under normal working conditions.

It might be thought that in a highly developed set of this type the handling of the controls would call for a corresponding degree of skill. This is far from being the case, as the geared micrometer dial with its open scale, and the accurate station calibration chart provided, offset any difficulties that might otherwise arise from the high selectivity of the H.F. circuits. There are only two knobs on the front of the cabinet, and both are arranged to combine a push-pull switching action with the usual rotary motion. Thus the right-hand knob takes care of waverange switching as well as tuning, and the left-hand control combines volume control with a sensitivity or "local-distance" switch and the main on-off switch. At the back of the set there is a three-position tone control for use when background noise is troublesome.

The set is a very pleasant one to handle and the automatic fading compensation reduces background noise to a negligible level on all worth-while stations. The range is at least as good as that of the average superheterodyne with an equal number of stages. The long-wave performance is particularly good and the selectivity on this range has not been bettered by any set so far tested. On medium waves, adjacent channel separation was possible on all stations other than those lying immediately on either side of the local stations. Under identical conditions, more channels are lost with many superheterodynes.

The permanent magnet moving-coil loud speaker is free from objectionable bass resonance, and the general character of the response is crisp and bright. This is probably due to accentuation of the upper middle register, as the high-frequency response above 3,500 to 4,000 cycles has been cut to reduce background hiss. Output is sufficient, but not exceptional.

Station Announcements

JANUARY, 1934, when the wavelength changes come into operation, presents the B.B.C. with an unique opportunity to remedy the confusing methods now employed in connection with "Station" call sign announcements. Let the B.B.C. scrap the grossly misleading "National" and "Regional" announcements in favour of the highly organised system of individual station "call signs" as adopted by the leading "networks" in America.

Wallasey. L. DAVIES.

Double Channel Transmission

MAY I endorse the suggestions made by Mr. Moor concerning double channel transmissions, in your issue of September 8th?

I suggest that the reason why electrically reproduced music sounds unnatural is that each instrument is fixed only by a system of "mono-focal" co-ordinates.

The use of a single channel for it with one or more microphones enables the mind to fix the position of the performers in one way only, namely, the distance from the microphone.

Now, if double-channel transmission were used, feeding into loud speakers placed at the same distance apart as the microphones, we have a system of bi-focal co-ordinates; each instrument is now definitely fixed by its distance from the two microphones *separately*.

The two receivers necessary could be built into the same cabinet with a loud speaker on each side, the two receivers having a common power unit.

I believe that by this means a high standard of reproduction could be attained, even with the receivers available commercially to-day. R. B. RANSOME.

Ipswich.

Wireless Set and Electricity Charges

YOUR reproduction of the notice issued by the Electricity Department of the Mexborough U.D.C. restricting the use of radio receivers to lighting circuits must have been read with very mixed feelings by those of your readers who, like myself, are, or have been, connected with the supply of electricity.

Until my resignation in 1933 I was for over eight years managing director of an electricity supply company, whilst I have owned radio receivers ever since 1921, so perhaps I am not unqualified to see both sides of the picture.

Let me say at the outset that I regard such a restriction as most short-sighted and extremely detrimental to the interests of the electricity department concerned. My personal experience is that the advent of the H.T. eliminator and then of the all-mains set led to the ousting of gas, at least for lighting purposes, in thousands of houses, and made a definite contribution towards making up the losses which the introduction of "Summer Time" inflicted on the supply industry. Furthermore, the relatively late hour to which broadcasting continues has undoubtedly led to a greater consumption of current in houses where there is a receiver. I have always done my best to foster the use of radio sets from the mains because I am convinced that radio is one of the quickest ways of getting electricity into a house and ensuring its developed use when there, but I frankly feel that the righteousness of your indignation led you to adopt a singularly unfortunate line of attack.

Nowhere in any of the Electricity Acts will you find any support whatsoever for your statement that the lighting rate can only be exacted where electricity is used for purposes of illumination.

There is, in law, no obligation whatsoever on a supply authority to sell its current at a rate below the maximum rate laid down in its Statutory Order, which in the case of the Mexborough Order is 8d. per unit, whereas the rate charged in that area for heating is 1d. per unit.

If, for the purpose of increasing its sales of current and levelling up its load, an undertaking concedes special rates for specific purposes, it is at liberty to lay down certain conditions, and consequently may dictate the type of apparatus which may be connected to circuits metered at these special rates.

Finally, I would point out that the prohibition contained in Section 27 of the Electric Lighting (Clauses) Act, 1899, of any control or interference by the supply authority with the consumers' manner of using electricity supplied to him has been held to apply only to cases where the maximum rate, permitted under the Order, is being paid by the consumer. D. N. W.

London, W.1.

Valves or Stages ?

THE letter of Mr. J. Baggs, of Messrs. Ferranti, Ltd., in *The Wireless World* of September 1st calls for a reply in support of the new description applied to multiple-valve receivers. Your leader of August 4th stated that a well-known firm of manufacturers, Messrs. E. K. Cole, Ltd., had adopted the principle of designating their receivers according to the number of stages —a stage being an anode-to-cathode electron stream. I agree with Mr. Baggs that to describe a receiver which incorporates even one multiple-purpose valve by the number of its valves would be misleading and unfair to the manufacturer of such a set, as it would be understating its capabilities. Clearly, then, some other description is necessary, and the new system appears to be the only sensible alternative, which after a short time has elapsed for its general adoption, cannot possibly lead to confusion.

In support of his criticism, Mr. Baggs states that in *The Wireless World* review of the Ferranti "Gloria" Consolette, in the issue of August 4th, it was wrongly described as a six-stage receiver. I agree with him that it has seven stages. Possibly *The Wireless World* omitted to take into account the A.V.C. diode, which does, of course, fulfil the condition of an anode-to-cathode electron stream. However, the system is quite new, and one cannot condemn it and strangle it at its birth.

The public must know what it is buying, and here again I must differ from Mr. Baggs. My experience is that the man in the street *does* know what he wants, and has, up to now, been guided in his choice very considerably by taking into account the number of valves employed in a receiver. When his neighbour becomes the plutocratic possessor of a four-valve set, against his three-valve, pride will not be satisfied until he himself purchases a five-valve. This is good for trade, Mr. Baggs, of the sales department, and you at least will be the last person to deny that the public should not be deprived of some reliable measure to guide its purchases. I contend that the "stage" description meets the case admirably.

Finally, I cannot congratulate Mr. Baggs on his solution of the problem. He states that his firm have "gone still farther than any of the foregoing proposals," by the simple process of not mentioning the number of valves or the number of stages at all! This, surely, is an Irishman's advance. It certainly does not help one iota.

Sheffield. G. A. TAYLOR.

IN your issue of September 1st we notice a letter criticising our new policy of describing sets by stages instead of valves. This suggestion is that a better method would be to make no mention either of stages *or* valves other than to list the valves in the specification.

The problem of how best to give a description of the capabilities of a receiver is admittedly difficult, but we do frankly believe that a "stage" is the best descriptive unit available at the present time.

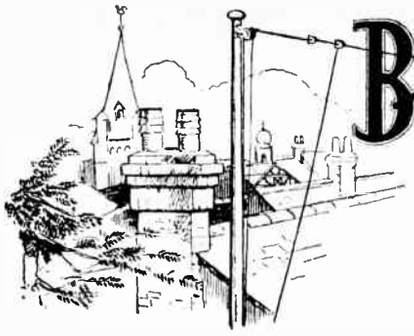
The alternative suggested by your correspondent to our view will not only maintain the use of "valves" but will also introduce once again our old friend the rectifier. The average member of the public has been brought up on "three-valve sets" and "six-valve sets," and similar terms. When he buys a new set he naturally wants to know something about it, and if it is not described as having "so many valves" he will count them either in the set or in their printed description. In both cases the rectifying valve is there to mislead him or to involve him in a lengthy argument.

The ideal method of description, no doubt, would be a term metaphorically equivalent to the use of "horse-power" in rating cars. Whether "stages" provides this equivalent or whether it has yet to be found must remain in question until future inventions and developments decide.

In conclusion, we regret that your correspondent should suggest that our new description will "open up the paths for misrepresentation." It was solely with the object of lessening this risk that we adopted it. Support for the method has been unanimous from Press, trade and public, the only note of dissension being from your correspondent. BARRY KAY,

Sales Promotion Manager, E. K. Cole, Ltd.

Southend-on-Sea.



Broadcast Brevities

By Our Special Correspondent

Provincial Progress

THE alterations in the studios and offices of the Midland Regional station are practically completed, and within a short time the staff will enter into full possession of the new and up-to-date studios, offices, and technical apparatus, all of which, following the experience gained at Broadcasting House and elsewhere, are devised to facilitate the task of programme production.

Personnel of the Midland Regional Station

The Station Director at Birmingham is Mr. Percy Edgar, well known to all Midland listeners as he has been in charge of the station for eleven years. With him will be Mr. H. G. Dunkerly as Programme Director, Mr. Victor Hely-Hutchinson as Musical Director, and Mr. Mostyn Webster as Director of Productions. Mr. Dunkerly has had a wide experience at the Liverpool and Manchester stations of the B.B.C., and has for the last month or so been in sole charge of the North Regional, while Mr. Mostyn Webster has for some time been engaged in the production of some of the revues and lighter programmes at Broadcasting House. Mr. Hely-Hutchinson is too well known to all listeners to need any introduction.

Midland Regional for the Midlands

When writing last week about the Aberdeen studio I gave Mr. Dinwiddie's slogan as "A fair chance for every town in Scotland," and Mr. Edgar holds strong views that the Midland Regional programmes should be, as far as possible, contributed by Midland artistes. At present those of local origin constitute only 40 per cent. of the whole.

Cardiff Studios

THE large single-deck studio at Cardiff has been reconstructed to make it double-height. The architect, Mr. Edward Maufe, who decorated the religious studio at Broadcasting House, has been responsible for the decorations as well as for those of a smaller studio.

New Premises at Bristol

At Bristol, new premises have been taken over by the B.B.C., and the Corporation has carried out certain alterations, while Mr. J. C. Proctor, the architect who decorated the studio in Leeds, is preparing designs for the decoration of a studio in Bristol which will be used for dramatic performances and talks. Mr. Proctor will also carry out the decoration of a new large studio to be constructed in the garden at the back of these premises.

Belfast Station

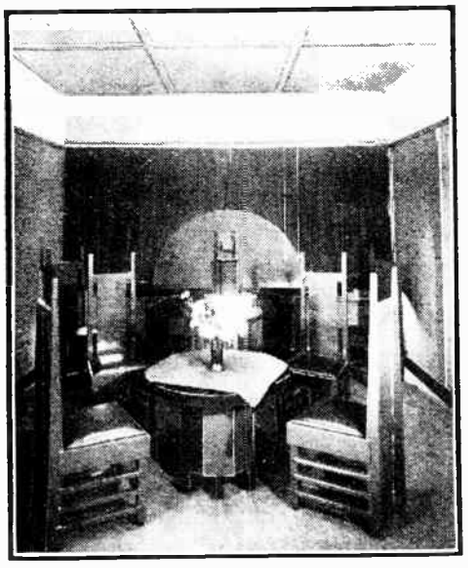
I UNDERSTAND that the question of the mineral rights of the site chosen for the new High-power Station for Northern Ireland is still unsettled, but the legal advisers of the B.B.C. are hopeful of a speedy solution of the difficulty. It is not intended that this station shall have twin transmitters as at Brookmans Park, but a single transmitter as at the projected Midland Regional station.

A Fair Warning

LISTENERS in Newcastle, Sunderland, Gateshead, South Shields, and the surrounding areas should make a note that the G.P.O. is arranging a "comb-out" of that district next month in order to trace unlicensed receiving apparatus. The investigation will probably start on October 2nd, so any listener whose conscience convicts him of working a wireless receiver without a licence and reads this note will have a day or two in which to repair this unfortunate omission.

The Wanderer's Return

TURNING to lighter and more pleasant subjects, I hear that when Mr. Henry Hall stepped off the "Berengaria" at Southampton last week he looked the picture of health and evidently was suffering no ill-effects from the overwhelming welcome he had received in America. He came back with considerably more luggage than he took out, and this increase included the scores of some of the American music which he intends to introduce to our notice.



NOT THE "SALLE À MANGER." An emergency studio at the Huizen transmitting station for use in case of a breakdown in the normal lines connecting to the main studios.

No Time Wasted

In the short space of a fortnight Mr. Hall met practically everybody of note in his particular sphere on the other side of the Atlantic, including Vincent Lopez, Wayne King, Emil Coleman, Johnny Morris, and Ben Bernie, who, I understand, delight all the "radio fans" of the United States. Their music, as interpreted by them, will be introduced to British listeners by Henry Hall during the winter months, so jazz enthusiasts may expect many a treat.

Talks on Sport

THE Talks Department of the B.B.C. has been busily engaged on the lighter side of its work, and is arranging an attractive series of sports talks by record-holders and other leading lights. In addition to Mr. H. W. Austin's discourse on Lawn Tennis to-morrow, Mr. W. C. Lyle on "Sport in other Countries" on October 7th, Mr. C. Buchan on "Association Football" on October 21st, and General Critchey on "Greyhound Racing" on October 25th, we are promised a talk by Larry Gains, the British Empire Boxing Champion, and by Colonel Peel on "Tunny Fishing," while, in all probability, listeners will also have an opportunity of hearing Sir Malcolm Campbell on "Motor Racing," Mr. and Mrs. Mollison on "Long Distance Flying," Stan. Woods on "Motor Cycle Records," Miss M. Foster on "Rifle Shooting at Bisley," and the veteran, Mr. J. H. Taylor, will give us an account of fifty years' experience in Golf.

The West Regional Director of Programmes

THE appointment of Mr. J. T. S. Sutthery as director of programmes for the West Regional station has, as usual, aroused some protest from Wales on account of his not being Welsh. The objectors do not seem to realise that the West Regional station serves the enthusiastic listeners in Devon, Somerset, Cornwall, Gloucestershire and Hereford, and should not, therefore, be considered as belonging exclusively to the Principality. I understand, also, that Mr. Sutthery spent a considerable part of his boyhood at Llandaff, so that he is not altogether a stranger to Wales.

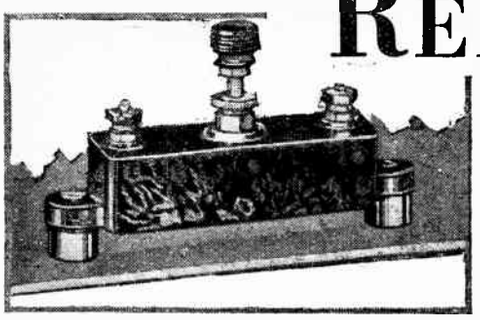
Anti-Interference Campaign

THE special committee of the I.E.E., formed at the instigation of *The Wireless World*, which is considering the best means of overcoming "man-made static," will get into its stride at the general meeting summoned for October 5th. Meantime its members are busy collecting more evidence for discussion in detail, and it is expected that the committee will have a busy time during the winter months.

Possible Legislation

The possibility of introducing some form of legislation under the Wireless Telegraphy Act will probably have to be considered. Even though experience shows that in a great number of cases it is not difficult to persuade parties responsible for various forms of interference to adopt ameliorative measures without having to resort to compulsion, yet legislation would remove the risk of unfairness. All manufacturers should be on the same basis, and imported apparatus, too, must be controlled. In the meantime the B.B.C. and the Post Office are handling an average of 150 complaints about interference each week.

READERS' PROBLEMS



Reducing stray capacity by mounting a compression type of condenser above a metal base.

Alternative Components

PROVIDED that a certain amount of discrimination be exercised, it is not essential that all the components used in building the New Monodial should be of the same makes as those employed in the original model; in many instances substitutions may be made without impairing performance.

But, with regard to the 0.002-mfd. compression condenser in the oscillator circuit, it should be pointed out that the particular make of component specified has a low residual capacity to earth when mounted in the normal manner on a metal baseplate. The substitution of other makes of condenser will in some cases add an excessive amount of stray capacity across the oscillator circuit, unless the precaution be taken of mounting the condenser some $\frac{1}{4}$in. above the metal base, as shown in the above illustration.

In order that the full range of capacity variation may be available, it will sometimes be necessary to place a rigid backing-plate of insulating material under the condenser.

Peaked Tuning

THE observant visitor to the recent Olympia exhibition may have noticed that a new expression has crept into the language of radio. This is "peaked tuning," which is now sometimes applied to circuit arrangements which differ in no obvious way from the band-pass filter with which we are all familiar.

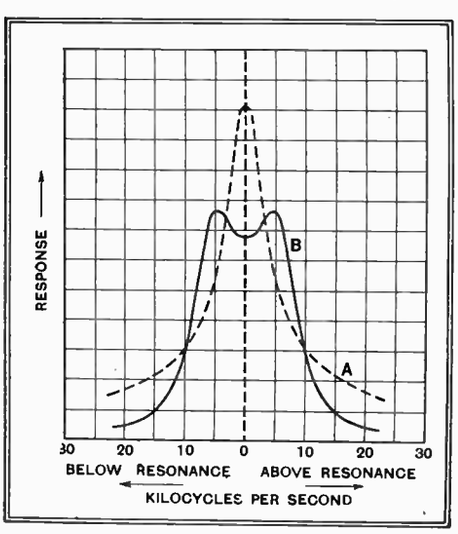


Fig. 1.—The double-humped resonance curve is that of a band-pass filter: the other is that of a similar pair of circuits, but coupled more loosely to give "peaked tuning."

A reader's request for information on this point may be satisfied by saying that peaked tuning differs from band-pass tuning only in that the coupling between the component circuits is made just close enough to give maximum transference of energy, but no "double hump." This is illustrated diagrammatically in Fig. 1.

This method of adjusting a two-circuit tuner is sometimes referred to as "peaked band-pass," which seems to be a contradiction of terms, as no attempt is made to pass on a definite band of frequencies at full strength. Of course, peaked tuning confers no immunity from sideband cutting, and so, when it is employed, suitable compensation must be made in the L.F. circuits by providing tone correction.

THESE columns are reserved for the publication of matter of general interest arising out of problems submitted by our readers. Readers requiring an individual reply to their technical questions by post are referred to "The Wireless World" Information Bureau, of which brief particulars, with the fee charged, are to be found at the foot of this page.

H.F. on Short Waves

SEVERAL readers seem to be uncertain as to the benefits likely to result from adding an aperiodic H.F. stage to their short-wave converters.

It should be made clear that no appreciable amount of true H.F. amplification is to be expected from such a stage, but, paradoxical as it may seem, the addition is one that can be thoroughly recommended. In the first place, radiation from the aerial and consequent interference with other listeners will be minimised, and also the interposition of the H.F. valve between the aerial and the tuned circuit will remove the damping effect of the former and make operation very much easier and more certain. In particular, the reaction adjustment will work more consistently, and "dead spots" should be absent.

Is the A.V.C. Working?

IT is far from easy to form a definite opinion as to whether an automatic volume control system is working properly. From its very nature, A.V.C. should function unobtrusively by maintaining volume at the required level irrespective of fluctuations in the strength of incoming signals.

Unless it is possible to make comparative tests during periods of fading against a receiver which is not fitted with A.V.C., it is almost impossible to check the functioning of the control system without the use of a milliammeter. This instrument should be connected in series with the anode circuit of one or of all the controlled valves, and a strong transmission should then be tuned in. If everything is working well, a considerable increase in anode current should take place as a result of touching the high potential end of one of the tuned circuits of the receiver. This will show that sensitivity is being automatically increased to make good the loss of volume which would otherwise arise through artificial detuning of one of the circuits. A still more convincing test may be made after darkness has set in by tuning in a short-wave station known to be subject to fading; violent fluctuations of controlled anode current will probably take place every half-minute or so.

The Low-pass Filter

THERE is no reason why the low-pass filter included in the New Monodial superheterodyne should not be adapted to almost any type of receiver, arrangements being made to place it in circuit when heterodyne interference is present. But it should be pointed out to a correspondent who raises this query that a filter of this kind is of little benefit in eliminating whistles due to second-channel and similar forms of interference.

Taken Too Literally

CERTAIN expressions used in the radio art are admittedly rather confusing to the newcomer, who is particularly likely to be misled by the terms "earth" and "earthy." One of our newer readers has been misled by the expression "earthed end of the tuning coil," as used by a more knowledgeable friend, and, by taking him literally at his word, has imposed an accidental short-circuit across his H.T. battery.

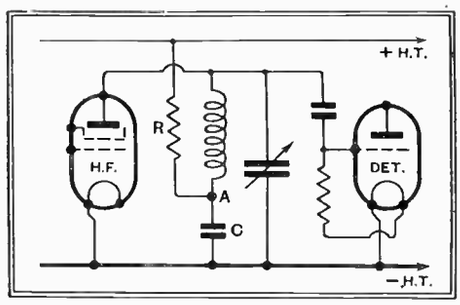

Fig. 2. Although point A may be positive with respect to earth by the full voltage of the H.T. battery, it is "earthy" so far as H.F. voltages are concerned.

It must not be assumed that the earthed or low-potential end of a circuit is always joined directly to the earth line, or chassis, of a receiver. The expression as generally used relates to the part of the circuit or component which is at low-potential with regard to signal-frequency voltages, whether H.F. or L.F. For instance, in Fig. 2, point A would be spoken of as the earthed end of the tuned anode coupling coil, although, so far as D.C. is concerned, it may be at a potential of a couple of hundred volts above earth. But there should be no appreciable signal-frequency difference of potential between point A and earth, as it is "tied down" by the combined action of the decoupling resistance R and the by-pass condenser C.

The Wireless World

INFORMATION BUREAU

THE service is intended primarily for readers meeting with difficulties in the construction, adjustment, operation, or maintenance of wireless receivers described in *The Wireless World*, or those of commercial design which from time to time are reviewed in the pages of *The Wireless World*. Every endeavour will be made to deal with queries on all wireless matters, provided that they are of such a nature that they can be dealt with satisfactorily in a letter.

Communications should be addressed to *The Wireless World* Information Bureau, Dorset House Stamford Street, London, S.E.1, and must be accompanied by a remittance of 5s. to cover the cost of the service. The enquirer's name and address should be written in block letters at the top of all communications.

EFFICIENCY
UNIFORMITY
LONG LIFE

KINGS OF THE AIR

You can appreciably improve the performance of your All-Electric Receiver, especially if it is two or three years old, by fitting the correct types of Cossor Mains Valves. Due to their advanced design and their famous Mica Bridge Construction, Cossor Mains Valves possess remarkable efficiency, uniformity and long life. Your dealer will tell you the types you need to make your Set like new again.

MISCELLANEOUS ADVERTISEMENTS

NOTICES.

THE CHARGE FOR ADVERTISEMENTS in these columns is

12 words or less. 3/- and 3d. for every additional word.

Each paragraph is charged separately and name and address must be counted.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions 5%; 26 consecutive, 10%; 52 consecutive, 15%.

ADVERTISEMENTS for these columns are accepted up to **FIRST POST on MONDAY MORNING** (previous to date of issue) at the Head Offices of "The Wireless World," Dorset House, Stamford Street, London. S.E.1, or on **SATURDAY MORNING** at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26b, Renfield Street, Glasgow, C.2.

Advertisements that arrive too late for a particular issue will automatically be inserted in the following issue unless accompanied by instructions to the contrary. All advertisements in this section must be strictly prepaid.

The proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Notes being untraceable if lost in transit should not be sent as remittances.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of private advertisers, letters may be addressed to numbers at "The Wireless World" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Wireless World." All replies should be addressed to the Box number shown in the advertisement, c/o "The Wireless World," Dorset House, Stamford Street, London, S.E.1. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

DEPOSIT SYSTEM.

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Wireless World," both parties are advised of its receipt.

The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50, 5/-. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.—Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

RECEIVERS FOR SALE.

H.M.V. Seven Valve Superhet, Lowboy, 3 months' old; first £16 10. Box 8154, c/o *The Wireless World*. [3561

BURNDEPT Universal S.G. Mains 5-valve; list 42 guineas, offers.—"Ely Lodge," St. Faith's Rd., S.E.21. 3538

D.C. Super Hetrodyne 200 250 volts, latest design, 6-valve single dial chassis; removing A.C. district; £10. —'Phone: Whitehall 1922. [3562

A.C. and Battery Receivers, built for Laboratory experimental work, to clear cheap; high class apparatus.—Write Engineer, 56, Hazel Rd., Kensal Rise, N.W.10. [3575

8 Guineas.—Ethatrope 200-240 A.C., 2 S.G. det. and pentode, automatic tuning, in walnut cabinet, with valves and moving coil speaker; listed 23 guineas, unopened; c.o.d., carriage paid.—Kay 167, City Rd., London, E.C.1. [3506

ARMSTRONG Latest 1934 Universal 4, A.C. D.C. chassis, 3 tuned circuits, giving approximately 9 kilocycles separation, incorporating gramophone amplifier, 11/2 watts output, massive chassis with practically superhet performance, fully guaranteed; 75/-; with 5 valves, 114/-; approval willingly. Armstrong Co., 100, King's Rd., N.W.1. [3563

MAINS EQUIPMENT

HOYNE'S Transformers and Chokes the Best Obtainable perfect insulation, regulation and reliability.

HOYNE'S Transformers used by many well-known set manufacturers after testing all others.

HOYNE'S Transformers fitted with tapped and screened primaries, filaments all centre tapped, stout cast aluminium clamps and clearly marked terminal strips are fitted to all models.

HOYNE'S Components are guaranteed for one year; built to your own specification at very competitive prices.

HOYNE'S Components.—The components you will eventually use, start right; a dud cannot pass the Hoyne test.

HOYNE'S New Monodial Super, aluminium chassis, drilled for components, complete with Power Transformer, two chokes, push-pull intervalve transformer and valve holders 51/-, carriage paid.

HOYNE'S New Monodial Transformer, 425-0-425v. 120 m.a., 4v 3a 4v. 1a., 4v. 1a., 4v. 6a., 24/-, post 1/3; weight 10lb. 10 henry choke, 6/-, post 6d.; 20 henry choke, 7/6, post 6d.

HOYNE'S.—250-0-250v. 60 m.a., 4v. 1-2a., 4v. 2-4a., 10/-, post 9d.; with extra 4v. 1-2a. winding, 12/6, post 1/-.

HOYNE'S Ferrocart Model.—350 0-350v. 60-70 m.a., 4v. 2-3a., 4v. 2-4a., 12/6, post 1/-; with extra 4v. 1-2a. winding, 13 6, post 1/-.

HOYNE'S.—350-0-350v. 120 m.a., 4v. 2-3a., 4v. 4-6a., 4v. 1a., 4v. 1a., 16/-, post 1/3.

HOYNE'S.—500-450-0-450-500v. 140 m.a., 4v. 2-4a., 4v. 4-6a., 4v. 2a., 4v. 2a., 27 6, post 1 3; weight 11lb.

HOYNE'S.—0-110-135v. 90 m.a., suitable for H.T. 6 or 7, 7 6, post 9d.; with 4v 2-4a. winding, 9/6, post 9d.

HOYNE'S.—200v. 200 m.a., 4v. 2-4a., 4v. 1-2a., for H.T. 8, 13 6, post 1/-.

HOYNE'S. Auto Transformers, Chokes and Filament Transformers always in stock.

HOYNE'S Components still have no equal.

PILOT AUTHOR KITS

Exact to Specification

AS FOUNDERS OF CONSTRUCTORS' SETS IN 1919, we have established a world-wide reputation for the supply of Complete Kits and Part Kits for all "Wireless World" Set designs. An essential feature of this Expert Service to the Home Constructor is IMMEDIATE DELIVERY FROM STOCK CASH or C.O.D. of any exclusively specified or difficult to obtain components. Rely on PETO-SCOTT, he always gives fullest satisfaction to every customer.

D.C. SUPER-HET

KIT 'A'—Author's Kit of First Specified Parts, including Peto-Scott Plymax Chassis and Ply Panel, assembled and drilled, less valves and cabinet.

Cash or C.O.D. Carriage Paid.

£12

or £2 Deposit and 11 monthly payments of 20/-.

Set of Specified Valves ..... £3-9-6.

THESE ARE THE PARTS THE AUTHOR USED:

		£	s.	d.
1	**PETO-SCOTT** Plymax chassis 16in. 10in. 2½in. with Ply Panel		12	6
1	**BRITISH RADIOPHONE** Super R.F. Radiopak, without volume control	3	15	0
2	**COLVERN** Ferrocart Coilcardynes, 110 kc/s.	1	5	0
1	**CLAUDE LYONS** Type P.S. 5,000 ohm potentiometer		5	6
1	**CLAUDE LYONS** Type 250 tapered volume control, 0.25 meg-ohm		6	6
1	**GOLTONE** Type SHF screened H.F. choke		4	0
2	**GOLTONE** Type PHF mains H.F. chokes		15	0
1	**HEAYBERD** No. 732 L.F. choke		12	6
5	**CLIX** chassis mtg. type 5-pin valveholders		3	9
1	**T.C.C.** Type 65 4 mfd. fixed condenser, 250 v. D.C. working		5	0
2	**T.C.C.** Type 50/2 mfd. fixed condensers, 200 v. D.C. working		7	0
3	**T.C.C.** Type 250 tubular type, 0.1 mfd., 350 v. D.C. working		4	0
1	**T.C.C.** Type M 0.01 mfd. fixed condenser		2	0
8	**IGRANIC** Type FF.12, one each 0.001 mfd., 0.002 mfd., four 0.0001 mfd., two 0.0002 mfd. fixed condensers		4	6
1	**T.C.C.** Type 521 dry electrolytic condenser, 50 mfd.		3	0
1	**CLAUDE LYONS** B.A.T. 728 make and break switch		1	6
1	**CLAUDE LYONS** B.A.T. 2728 double-pole single-throw switch		3	3
2	**BELLING LEE** Type "B" ebonite-bronded terminals, A & E		1	0
2	**WESTINGHOUSE** W.6 Westectors		15	0
1	**CLAUDE LYONS** Type FW.25 25-ohm resistor		1	6
9	**SERADEX** Type M150 1½-watt resistances: one each 100 ohm, 250 ohm, 20,000 ohm, .1 meg., .5 meg., 1 meg., 2 meg.; two .25 meg.		6	0
2	**SERADEX** Type G250 10,000 ohm 2½ watt resistances		3	0
1	**BULGIN** Type "OB" bulb, 6 volts 0.15 amp.			6
1	**BELLING LEE** Type 1033 twin safety fuseholder, with 1 amp. fuses		2	6
1	Length **HARBROS** screened sleeving			9
1	**OSRAM** Barretter No. 251 voltage regulator		12	6
4	oz. No. 20 tinned copper wire; 10 lengths Systoflex, wire wood screws, etc.		5	0
1	**PHILCO** Type No. 27 6005 7-pin valveholder		1	0
1	**PHILCO** Type 1897 grid clip for 6A7 valve			1
1	**BRITISH RADIO GRAMOPHONE** 5-pin plug		2	3
	KIT "A" CASH OR C.O.D.	£12	0	0

PETO-SCOTT PLYMAX CHASSIS AND PLY PANEL SOLELY SPECIFIED. Plymax Chassis as specified by the Author, drilled and assembled, 16" × 10" 2¾". Cash or C.O.D. Post and Packing 1/3 extra. **11/6**

COMPLETE KIT As Kit 'A' but with Specified Valves and Peto-Scott Walnut D.C. Superhet Cabinet. Cash or C.O.D. Carriage Paid **£16-12-0**

or £3-12-0 Deposit and 11 monthly payments of 26/-.

FINISHED INSTRUMENT

D.C. SUPER-HET—Ready Assembled exact to Author's Specification with Valves. Aerial Tested. Cash or C.O.D. Carriage Paid **£21**

or £5 Deposit and 11 monthly payments of 32/-.

RECOMMENDED

PETO-SCOTT WALNUT D.C. SUPER-HET CABINET

A Handsome figured Walnut Cabinet specially recommended for the D.C. Super. Constructed throughout with well-seasoned timber by London's leading piano craftsmen. Front ready drilled for panel controls. Cash or C.O.D. Carriage Paid. Size 16" 10" 10"

RADIO DATA CHARTS

A SERIES OF ABACS

providing most of the essential Data required in Receiver Design

By

R. T. BEATTY, M.A., B.E., D.Sc.

Reprinted from "The Wireless World"
(1930)

"Radio Data Charts" provide designers of wireless apparatus with a ready and convenient means of solving problems without having recourse to complicated formulæ and mathematics.

By the use of the charts it is possible to tackle all the more familiar problems in radio receiver design, such as, for example, finding the relationship between inductance capacity and frequency, and working out the design of high frequency transformers. All keen amateurs will appreciate this helpful book.

(39 CHARTS and more than 50 Diagrams)

VALVES.—All types American screen grids, etc., in stock; send for quote. Mildmay Radio Exchange, 24, Mildmay Grove, London, N.1. [3531a

ALL Classes of Valves in Stock, including American and non-ring valves; send for price list.—R. Newman, 309, Romans Rd., London, E.3. [3446

ALL Types of Valves in Stock, including the following brand new American valves, first class makes: 247s, 235s, 224s, 236s, 237s, 233s, 245s, 244s, 12 -; 227s, 226s, 280s, 245s, 9 6; 242s, 232s, 11/-; U.X.210s, 15/-; U.X.250s, 7 watts output, 16 -; 281s, 14/6; post paid, cash with order or c.o.d. Send for valve list.—Ward, 12, Tredegar Rd., Bow, E.3. Tel.: Advance 3668. [3488

SPECIAL Offer.—Valves by world-famous Continental manufacturers, fully guaranteed, screen grid, variable mu screen grid, high magnification screen grid, low magnification screen grid, H, HL, L, RC, power, super power, directly heated pentode, directly heated power pentode; all the above standard mains type, 4 6 each; 300v. 60 milliamp. rectifier 5 6, 350v. 120 ma. 6 6, 500v. 125 ma. 7 6; the following 4 volt battery valves at 2 - each, H, HL, L, power, screen grid. Premier Supply Stores, 20-22, High St., Clapham, S.W.4. Macaulay 2188. [3582

COMPONENTS, ETC., FOR SALE.

R.

SELECTED Parts for Sale, as new; c.o.d. or "Wireless World" deposit system, which we recommend if in doubt as to the splendid value offered; we take risk of damage in transit to our customers; goods tested for callers and guaranteed.

"WIRELESS World" Quality Amplifier, to specification, with valves, March 25th, 1931, £7; Bakers' super 6v. speaker, cone repaired, 20 -; Magnavox D.C.144, 2,500 ohm speakers, new. Pentode transformer, 22 6; British Radiophone 3-gang condensers, new, with proper cover, disc drive and all fittings, 15 9; Triotron 8 mf. electrolytic, 3 6; Polar 2-gang tubs, 6 6; Polar 3-gang tubs, 10 -.

NEW Output Transformers Similar to R. and A., ratio 18 23 32, 6 -; Telsen 0.05 mica condensers, 2 3; T.C.C. 0.01 mica type M, 1 -; new Paxolin formers, 1in., slotted, with guiders, 8d.; T.C.C. 2 mf., 350v. working, 1/6; ditto, 1 mf., 1 3, new; T.C.C. 4/4, 250v. working, 4/9.

PAIRS New Polar Twin S.M. Thumb Drive, 0.0005, complete, 12 6; Telsen 100h. chokes, 3/-; Westinghouse H.T.4 and A4 rectifiers, with Varley transformers, £2; Clyden 0.0005 double thumb twin extenser, 15 6; Clyden single 0.0005 extenser, 7 6; Ready Radio 0.0005 extenser condensers, new, 3 6; Ormond 65 - type P.M. speaker, complete, 37 6.

RADIOPHONE Pots with Switch, 5,000, 10,000 100,000, 25,000, new, 2 6 each; new type Magna speaker, 2,500 ohm and 5,000 ohm, 42 6 each complete.

FERRANTI Resistances with holder, 3,000, 15,000, 20,000, 2 6 each; Varley Power, 500, 5,000, 10,000, 40,000 2/6 each.

TRANSFORMERS.—Ferranti A.F.4 8 -, A.F.3 12 6, A.F.5 18 6, A.F.5c 21 6, O.P.M.1c 16 6, O.P.M.2 13 -, O.P.M.4c 16 6; B1 choke, new, 13 -; A.F.6 18 6.

EDISON BELL 10,000 Eureka, wire wound, with holders, 1 -; Edison Bell 0.0005 universal log all-metal condensers, 1/6, new.

AMPLION Public Address Microphone, £3; Ready Radio Senior Instamat matching transformers, new, 10 25-1, 15/9; G.E.C. Senior induction motor, 47 6; set Colvern battery Super Five coils, 10 -; set Colvern single dial super battery coils, 15 -; Mullard H.T. eliminator, complete, 150v. 30 m.a., 240v. input 30 -; Six-Sixty eliminator, 200v. 25 m.a., and G.B., 32 6; Ekco A.C.25, 47/6; Atlas A.C.244, 39/6.

ROLA

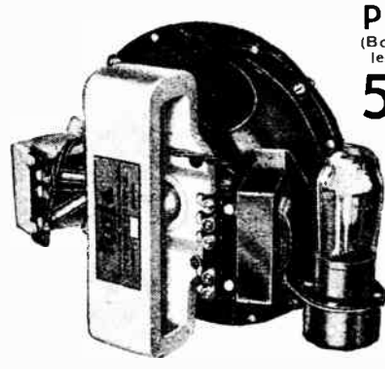
the World's Finest Reproducers

QUALITY Class B for *Every* Battery Set Owner

No battery set owner need be without the advantages of Class B Amplification. By using a Rola Class B Speaker Amplifier Unit which takes only 5 seconds to connect, the vloume of the set is instantly increased about 5 times.

Model A —For MULLARD P.M. 2B. B.T.H. PD 220, COSSOR 220 B, STANDARD 13 B.1, HIVAC B220, MARCONIPHONE B21, G.E.C. B21, CLARION B22.
Model B For COSSOR 240, FERRANTI HP 2, CLARION B 24.

PRICE (Both Models less Valve) 57/-



ROLA CLASS B SPEAKERS

No matter what Class B Valve you are using there is a Rola Class B Speaker to match its characteristics. Like all Rola speakers these Class B Units are unrivalled for realistic reproduction.

For MULLARD P.M. 2B, B.T.H. PD220, COSSOR 220B, STANDARD 13B1, HIVAC B220, MARCONIPHONE B21, G.E.C. B21, CLARION B22.

ROLA FR5—PM—33—Class B	29 6
ROLA FR6—PM—23—Class B	39 6
ROLA F6 —PM—23—Class B	49 6
ROLA F7 —PM—23—Class B	60 -

For COSSOR 240, FERRANTI HP2, CLARION B24.

ROLA FR5—PM—32—Class B	29 6
ROLA FR6—PM—22—Class B	39 6
ROLA F6 —PM—22—Class B	49 6
ROLA F7 —PM—22—Class B	60 -

All Prices include Transformer.

ROLA SPEAKERS *for better Radio Reception*

Components, etc., for Sale.—Contd.

(This advertisement continued from first column.)

PAIR Varley Q.P.P. Input and Output, 19/-; Wearite and Lewcos superhet. coils, 5 -; 3-range oscillators, 7/6; T.C.C. 2,000 mf. electrolytic, 9 -; T.C.C. ditto, 250 mf., 100v., 8 6; Igranic L.F. choke coupling units, 3/9; Lotus new 4-gangs, 15 9.

RYALL'S Mains Condensers, 4 mf., 250v. working, 2/6; 4 mf., 500v. working, 4/6; 4 mf., 750v., 6/6; 2.000v., 17/6; Ryalls condenser blocks, 2-4 mf., 2-2 mf., 500v. working, 8/6; Dubilier 2×2, 500v. working, 2/6.

RYALL'S Mains Transformers, 250v. 60 m.a., 4v. 1 amp., 4v. 3 amp., 10/6; 350v., 12 9; H.T.7, with 4v. 4 amp., 10/6; 4v. 3 amp. only, 6 9; chokes, 25h. at 60 m.a., resistance 260 ohms, 6 9; 20h. at 100 m.a., 8/9; 10h., 8 9, for Monodial; 40h. at 100 m.a., 10/6.

RYALL'S RADIO Offer Reliable Resistances, 1 watt, suitable for all "Wireless World" sets where a 1 watt resistance is specified, in values 100, 500, 1,000, 2,000, 5,000, 6,000, 10,000, 25,000, 30,000, 75,000, 150,000, 250,000, 20,000, all values stated in ohms, 6d. each, guaranteed one year, wire ends, new goods.

WE Hold a Large Stock of First Class Radio Apparatus, meters, resistances, condensers, heavy chokes, and all set requirements, at bargain prices, all modern goods.

RYALL'S RADIO, 33, Chancery Lane, London, W.C.2 (nearest Tube Chancery Lane; 'bus 67 passes door, or tram to Savoy St.). Holborn 3529. Open Saturday afternoon. Close 7 p.m., Thursdays 1 o'clock, Saturday 6 p.m.

R. [3545

PREMIER.

PREMIER SUPPLY STORES Offer the following Set Manufacturers' Surplus New Goods at a fraction of the Original Cost, all goods guaranteed perfect, carriage paid over 5 -, under 5 - postage 6d. extra (Ireland, carriage forward).

ELIMINATOR Kits, including transformer, choke, Westinghouse metal rectifier, T.C.C. condensers, resistances and diagram, 120v. 20 m.a., 20/-; trickle charger 8/- extra; 150v. 30 milliamps with 4v. 2-4 amps., C.T., L.T. 25 -; trickle charger, 6 6 extra; 250v. 60 milliamps, with 4v. 3-5 amps, C.T., L.T., 30/-; 200v. 100 milliamps, with 4v. 3-5 amps, C.T., L.T., 49 6; 300v. 60 milliamps, with 4v. 3-5 amps, C.T., L.T., 37 6.

ROLA Moving Coil Speakers, complete with humbucking coils and output transformer; please state whether power or pentode required; F6, 2,000 or 6,500 ohm, listed 35 -, at 17 6; F7, 2,000 or 6,500 ohm, listed 47 6, at 23 6; A.C. conversion kit for any of above, 10 -.

SPECIAL Offer.—Reisz type microphone with transformer, a really professional job, listed at £12; our price 52 6.

HEAVY Duty Variable Resistances, wound on porcelain, 2,000 ohms 1-4 amp., 500 ohms 1-2 amp., 120 ohms 1 amp., all the above values, 3 6 each.

T.C.C. Condensers, 750v. working, 2 mf. 3 6, 4 mf. 6/-, 4 mf. 400v. working 4/-, 250v. working 1 mf. 1/-, 2 mf. 1 9, 4 mf. 2 6, 1,500v working Standoff insulators 0.5 mfd. 1 6, 2 mfd. 6 -, aqueous electrolytic 440v. working, 4 mf. 3 -, 8 mf. 3 6.

DUBILIER Condensers, 0.01 mica, 6d.; 1 mf. 1,000v. working, 1/6.

ALL the Following Lines 6d. each or 5 - per dozen: 4- and 5-pin chassis mounting valve holders; shielded screen grid or pentode leads 1-watt wire end resistances, any value; T.C.C. 0.1 condensers; hum dingers; on-off switches pushpull; polar ganging devices.

POLAR 3-gang 0.0005 Condensers, split end vanes, totally screened disc drive; 6/11.

AMSCO Triple-gang 0.0005 Condensers, with trimmers, 4 11.

KOLSTER BRANDES Gramophone Motors, dual type, can be worked by clockwork or mains. No. 1 induction type 100-250 volts, 27/6; No. 2, A.C. and D.C., 100-250 volts, 27 6; both the above complete with all fittings and turntable.

SPECIAL Offer.—Microphones by prominent manufacturer, high sensitivity, uniform response, complete with stand, transformer and battery; listed £3 15, our price 18 6.

DUBILIER Condenser 300v working, 4+4+2+2+2+0.1+0.1+0.1; 6 -

PREMIER British Made Meters, moving iron, flush mounting, accurate; 0-15, 0-50, 0-100, 0-250 milliamps, 0-1, 0-5 amps., all at 6 -.

ORMOND Condensers, 2-gang semi shielded, 2 6.

WESTERN ELECTRIC Mains Transformers, input 200-250 volt, output 500-0-500 volt, at 150 milliamps., 4v. 4a., 4v. 2.5a., 4v. 2a., 4v. 1a., 4v 1a., massive job; 19 6.

T.C.C. Electrolytic Condensers, 100 volts working, 15 mfd.; 1 3.

SPECIAL Offer of Mains Transformers, manufactured by Philips, input 100-115v. or 200-250v., output 180-0-180 volts, 40 m.a., 4v. 1a., and 4v 3a., 4/6; 200-0-200v., 4v. 1a., 4v. 3a., 4/6.

ALL Premier Guaranteed Mains Transformers have engraved terminal strips with terminal connections, input 20-250 volts, 40-100 cycles, all windings paper interleaved.

PREMIER H.T.8 Transformer, 250v. 60 m.a., rectified, with 4v. 3.5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 25 -.

T.C.C. 2,000+2,000 Electrolytic, 12 volts working; listed 27/6, at 10 -.

ROLA F5 P.M., 18 6; Rola F6 P.M., 22/6; Rola F7 P.M., 32 -; please state whether power or pentode transformer.

PREMIER H.T.9 Transformer, 300v. 60 m.a., rectified, with 4v. 3.5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26 -.

T. W. THOMPSON & CO.

SURPLUS CLEARANCE DEPOT

17, Strutton Ground, WESTMINSTER, S.W.1.

Telephone: Franklin 6355.

Nearest Station, St. James's Park (Underground).

ALL GOODS ON THREE DAYS' APPROVAL AGAINST CASH OR C.O.D. (I.F.S. EXCEPTED).

Open Week-days 9 o'clock until 7.30 p.m.

Another Great Purchase of Surplus Materials, including Manufacturers' Stocks of H.M.V., Yagerphone, Fay Home Recorders, etc.

FAY "ACOUSTIC" MODEL HOME RECORDERS.—Comprising tracking device, needle sharpener, fibre needles, and recording diamond stylus, acoustic soundbox and horn, brand new in box. Great amusement for anybody making their own records. Listed 30/-, to clear 5/- each, post 6d. **ALUMINIUM DISCS READY FOR RECORDING.**—To suit above, 6in. dia., 5/- dozen; 12in. dia., 8/- dozen, post 6d. **FAY RECORD ALBUMS.**—To carry 10in. records, very neat and beautifully covered, 1/- each. **OUR GREATEST BARGAIN** of the Fay Radiogram model, special sensitive microphone, complete with stand and spring suspension, perfect for public address. Large quantity, to clear **10/6**, each, new and boxed, post 1/-. Impossible to repeat at the price. Equal to the Reisz-pattern microphone. On our terms we ask you to try before you buy. **ELECTRIC SOLDERING IRONS.**—200/250 v., best makers, 5/- each. **UNIVERSAL MOTORS.**—1/5th h.p. A.C. or D.C. 200/250 volts, **15/6**, post 9d. **WEGO CONDENSERS.**—With tappings 3.6 m.f., 500 v., new, **1/6**, post 3d.; 8 m.f. Hydra Condensers, 1,000 v. test, **2/6**, post 3d. **U.100.**—Balanced armature loud speakers, complete with cone and chassis, **15/6**, new and boxed, post 9d. **PRIVATE HOUSE AND OFFICE TELEPHONES.**—Complete units, consisting of pedestal telephone with Receiver, magneto, ringing and battery. All types highly useful for extensions, sick rooms, etc., **12/6** each, post 1/-. **ELECTRIC LIGHT AND POWER CHECK METERS.**—For A.C. mains, 200/250 volts 50 periods. No more wondering as to the amount this or that article is using. Here is the check on same. Useful for checking consumption of sub-let flats, charging plants motors, wireless apparatus, or anything using electricity. Makers: Westinghouse and other well-known makers. Jewelled pivots. Cost £4/18. We are clearing these at **6/-** each, post 1/3. ONLY 10 OF THESE LEFT OUT OF A TOTAL OF 600, which we advertised 2 weeks ago. SECURE ONE BEFORE TOO LATE. ONE OF OUR BEST BARGAINS FOR YEARS. **ECKERSLEY TROUGHTON BALANCED ARMATURE SPEAKERS.**—Complete with 12in. chassis and cone, beautiful reproduction, new and boxed, listed 27/6, to clear, **6/11**, post 9d. **LAMPLUGH MOVING-COIL SPEAKERS.**—SILVER GHOST, 200/250 volts D.C., listed 27/6, to clear **10/-** each, perfect. A.C. model, **22/6**, post 1/-. **PHILIPS CHOKES.**—As used in Philips All Mains receivers. Highest grade nickel iron stamping, special winding. Highly impregnated manufacturers' type, 20, 25 and 30 henrys. Out of many thousands of these, only a few hundred remain. A wonderful offer, far too good to be missed. Many pleasing testimonials received from highly satisfied customers. **ELIMINATOR VOLTAGE CONTROLS.**—Listed 5/6, to clear **1/-**, post 3d. **TRANSFORMERS, EKCO.**—All for 200/250 volt input, tapped outputs 350-0-350 volt 80 m.a., 4 v. 4 amp. and 4 v. 2 amp., **10/6**, post 1/-. **CRYPTO CONVERTERS.**—Input 200/220 volt D.C., output 200 volts A.C., 100 watt, complete with starter and hum-proof smoother. Price **£4/15**, worth double the amount. **REGENTONE ALL-MAINS TABLE CONSOLE CABINETS.**—Polished walnut, size 19in. × 16in. × 10in., beautifully designed, complete with felt-lined baffle, **10/6**, post 1/-. Owing to the exceptionally heavy demand for these, we would advise an early ordering to avoid disappointment. **D.C. ELIMINATORS.**—200/250 volts input, output 150 volts 30 m.a., 2 pos. tappings, 1 var., all new and guaranteed, **10/6**, post 9d.; 3 positive taps, and variable, **15/-**, post 9d. THESE ALL A POSITIVE SNIP FOR THE MONEY. BUY ONE WHILST THEY LAST. **COLLARO INDUCTION GRAM. MOTORS.**—Latest type, complete with automatic stop and all fittings, boxed and unused, **£1/17/6**, post 1/-. **WEGO MOULDED BAKELITE CONDENSERS.**—With terminals, 700 volt test 1 m.f. **1/-**, post 3d.; per dozen **10/-**; 2 m.f. **1/9**, post 3d., per dozen **18/-**; 1 m.f. **2/8** each, per dozen **2/3** each. **CONDENSER BANKS, ETC.**—8.25 m.f. T.C.C. tapped 500 v., **2/9**, post 3d.; 10.5 m.f. T.C.C. tapped, **3/-**, post 4d.; 8.5 m.f. H.M.V. tapped, **2/6**, post 1/-; 3.6 m.f. Wego 500 volt tapped, **1/9**, post 3d.; 8 m.f. Siemens 700 volt working, **2/6**, post 3d.; 1 m.f. Siemens 500 volt, **2/-**, post 3d. **FARADEX INTERVALVE TRANSFORMERS.**—**2/6**, post 4d. Faradex Mains Chokes, **2/-**, post 3d. **CENTRALAB DOUBLE VOLUME CONTROLS.**—Listed 10/6, to clear **2/6**, post free. British Radiophone Controls, with combined switch, **2/-**, post 3d. **PHILIPS 1-WATT RESISTANCES.**—Full range from 400 ohms up to 100,000, **6d.** each, post free. **TO BE CLEARED CHEAP.**—10,000 manufacturers' type Edison Bell small fixed Condensers, sample box, 36 in box, **1/-** each, post 3d. **DUR AMESCO 3-GANG VARIABLE CONDENSERS.**—As used in H.M.V. sets with trimmers. Can be dismantled and used as 2-gang, brand new, **9/6**, post 6d.

(See Classified Advt. on page 27).

Components, etc., for Sale.—Contd.

(This advertisement continued from previous page.)

PREMIER H.T.10 Transformer, 200v. 100 m.a., rectified, with 4v. 3-5a. c.t. L.T., and screened primary, 15/-; with Westinghouse rectifier, 26/-.

PREMIER Mains Transformer, output 135v. 80 m.a., for voltage doubling, 8/6; 4v. 3-4a. c.t. L.T., 2/- extra; Westinghouse rectifier for above, giving 180v. 30 m.a., 8/6.

PREMIER Mains Transformers, output 250-0-250 volts 60 m.a., 4v. 1-2a., 4v. 2-3a, 4v. 3-4a. (all c.t.), with screened primary, 15/-.

PREMIER Mains Transformers, output 350-0-350 volts, 90 m.a., 4v. 3-5a., 4v. 2-3a. (both c.t.), with screened primary; 15/-.

PREMIER Mains Transformers, output 400-0-400 volts, 100m.a., 4v. 4-5a., 4v. 2-3a., with screened primary; 15/-.

PREMIER Auto Transformers, 100-110/200-250 volts or vice versa, 60-watt, 7/9; 100-watt, 10/-.

SPECIAL Offer of Manufacturers' Type Transformers, any input, output 250-0-250 volts, 60 m.a., 4v. 1a., 4v. 3a. (both c.t.), 8/6; H.T.8 transformer, with 4v. 3-4a. (c.t.), 8/6; with rectifier, 18/6.

AMPLION Mains Transformers, input 100-250 volts, output 350-0-350 volts, 120 m.a., 4v. 5a., 4v. 2a., 6v. 1a. (all c.t.); 17/6.

FILAMENT Transformers, polished and engraved terminal boards, N.P. terminals, 4v. 3-4a., 5/-; 10v. 3a., 6/6; 12v. 1a., 5/-; 4v. 4-6a., 6/6; 14v. 4a., 6/6; 22v. 1a., 6/-; 6v. 2a., 5/-; 9v. 1a., 5/-; 35v. 3a., 15/-.

PREMIER Chokes, 40 m.a., 25 hys., 4/-; 65 m.a., 30 hys., 6/-; 150 m.a., 30 hys., 10/6.

PYE Chokes, 20 or 32 hys., 4/-; Premier multi-ratio output transformers, giving 15 different ratios, 7/6.

PREMIER Eliminators, input 200-250 volts, 40-100 cycles, A.C., incorporating Westinghouse metal rectifiers, output 250v. 60 m.a., S.G. and 120v. taps, 42/6; with 4v. 4a. c.t. L.T., 7/6 extra.

BRITISH RADIOPHONE Wire Wound Potentiometers, with mains switch incorporated, 5,000 ohms, 10,000 ohms, 50,000 ohms, 100,000 ohms., 250,000 ohms, any value; 3/6.

PREMIER Eliminators, output 150v. at 30 m.a., S.G., and 100v. taps, with 4v. 3-4a. c.t. L.T., 37/6; or with trickle charger, 42/6.

PREMIER Eliminators, output 120v. at 20 m.a., S.G. and 100v. taps, 27/6; with L.1. trickle charger incorporated, 35/-.

PREMIER D.C. Eliminators, output 120v. at 20 m.a., S.G. and 100v. taps; 15/-.

ACCUMULATOR Chargers, 200-250 volts A.C., all incorporating Westinghouse metal rectifiers; 2, 4, and 6v. at ½ amp., 12/6; 2, 4, and 6v. at 1 amp., 17/6; 12v. 1a., 27/6; 6v. 2a., 35/-; 12v. 2a., 35/-; 12v. 1.5a., 30/-; 6v. 3a., 39/6; 30v. 1a., 42/6; 50v. 1a., 62/6.

AMPLION High Inductance Chokes, resistance 2,500 ohms, 80 henries, 60 m.a.; 5/6.

WESTINGHOUSE Metal Rectifiers: 120v. at 20 m.a., 6/6; 180v. at 30 m.a., 8/6; 8v. at ½ amp., 6/6; 6v. at 1 amp., 9/6.

B.T.H. Induction Type (A.C. only) Electric Gramophone Motors, 100-250v.; 30/- complete.

AMPLION Moving Coil Speakers, type E.M.644, dual fields, 2,500 and 5,000 ohms (100 and 200v.), with output transformer, 12/6; A.C. conversion kit for this speaker, 10/- extra.

WESTERN ELECTRIC Condensers, 250v. working, 1 mfd. 6d., 2 mfd 1/-; 500v. working, 1 mfd., 1/-.

T.C.C. Condensers, 250v. working, 4×4×1 mfd., 3/6; 6×4×2×2×2 mfd., 375v. working, 6/11; 4×4×1, 6/-.

SPECIAL Offer of Wire Wound Resistances.—4 watts, any value up to 10,000 ohms, 1/-; 8 watts, any value up to 15,000 ohms, 1/6; 15 watts, any value up to 50,000 ohms, 2/-; 25 watts, any value up to 50,000 ohms, 2/6; 50 watts, any value up to 50,000 ohms, 3/6.

WIRE Wound Potentiometers, 15,000 ohms, 1/6; Centralab Potentiometer volume controls, 50,000 ohms, 2/-; Colverstats, logarithmically wound Potentiometers, 6,000 ohms, 1/9.

FOR Callers Only.—The following valves, guaranteed new:—

THE Last Few Western Electric 321A-D Valves, 10v. 3a. filament, 750-1,000v. plate, 50-65 m.a., impedance 3,500 ohms, amplification factor 12; cost £5, to clear at 15/-.

PHILIPS 328 Valves for L.T. Charging, 5/6; 329 Barreter lamps, 2/-.

HARLEY Pick-ups, with arm and volume control; 12/6.

PREMIER SUPPLY STORES, 20-22, High St., Clapham, S.W.4. Macaulay 2188. Closed 1 o'clock Wednesdays, open to 9 o'clock Saturdays. Nearest Station, Clapham North Underground.

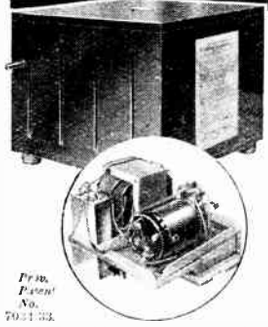
TURN YOUR D·C TO A·C THIS SIMPLE WAY...



Prov. Patent No. 7031/33.

All the best Receivers are made for A.C. Power. The "NO-RO-CO" (non-rotary) Converter enables you to run A.C. sets from D.C. Power mains immediately. Works on voltages from 200-250. Operates sets from 2-valve to 9-valve. Fitted with specially made ball-bearing motor with automatic switch and cut-out. Noiseless and safe. Fully guaranteed. Can be installed by a novice in a few minutes. Revolutionary in practice and revolutionary in price. Send for fully descriptive leaflet.

VALVEHOLDERS
Specified for the
D.C. SUPERHET

Clix New "Airsprung" Anti-microphonic Valveholder is designed to—

- Damp out actual physical shocks to the valve.
- Insulate the valve from consistent vibration set up by the transformer on the chassis.
- Counteract and absorb the air pulsations set up by the increased acoustic output of modern receivers.

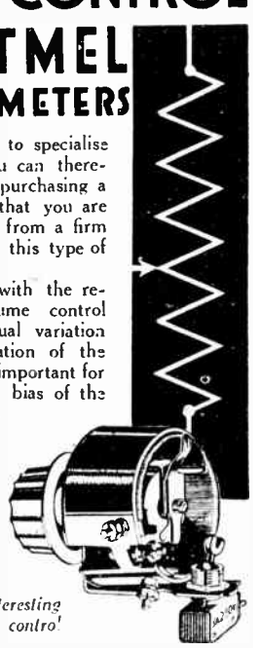
For PERFECT VOLUME CONTROL — WATMEL POTENTIOMETERS

Our Policy this year is to specialise in Potentiometers. You can therefore be certain when purchasing a Watmel Potentiometer that you are obtaining the very best from a firm that is concentrating on this type of component.

This resistance meets with the requirements for a volume control which will have an equal variation of volume for the rotation of the knob. This is specially important for the control of the grid bias of the new variable-Mu valves.



Here is illustrated the Watmel Type 2 Potentiometer with mains switch.

Price.

Square Law Winding 8/6
Without Mains Switch 6/6
Type 1.

Standard Winding 5/6

Special models made for manufacturers and for the Export Market.

SOUND SALES, Ltd., for Class "B" Components. List "B.B." on request.—Tremlett Grove, Highgate, N.19. [0491

MISCELLANEOUS.

EASY Payments.—We supply, by easy payments, components, accessories, and sets, any make; 10% down, balance spread over 11 months.—Send list of requirements to London Radio Supply Co., 11, Oat Lane, London, E.C.2. [0237

ENGINEERS and Technical Workers of All Kinds.—A proper training by post in your spare time will take you through your right examination, the employment is waiting. Our advice on all careers free.—Dept. 92, The Bennett College, Ltd., Sheffield. [0395

AMBITIOUS Men.—Qualify for a well-paid post by studying at home with the T.I.G.B. Write to-day for "The Engineer's Guide to Success," 144 pages, free, which contains the widest selection of engineering and wireless courses in the world, and shows you how to become A.M.I.E.E., A.M.I.Mech.E., A.Rad.A., etc. State branch, post, or qualification that interests you.—The Technological Institute of Great Britain, 82, Temple Bar House, London, E.C.4. (Founded 1917. 19,000 successes.) [3398

PATENT AGENTS.

A. MATHISEN, B.Sc., Patent Agent and Consulting Electrical Engineer, First Avenue House, High Holborn, London, W.C.1. Holborn 8950. [3496

PATENTS and Trade Marks, British and Foreign.—Gee and Co. (H. T. P. Gee, Member R.S.G.B. and A.M.I.R.E.), 51-52, Chancery Lane, London, W.C.2. 'Phone: Holborn 1525. [0001

REPAIRS.

REPAIRS.—Rebuilding to any set; highest quality work only; lowest charges; estimates given free; distance no object.—L. Eastwood, Radio Manufacturers' Consultant, late of His Master's Voice and Marconi Wireless Telegraph Co. Telephone: Clerkenwell 4520. Address: 70, Pitfield St., Hoxton, N.1. [3544

GUARANTEED Repairs by Experts; specialists for repairs to S. G. Brown and Amplion radio apparatus, also loud-speakers, headphones, pick-ups, Blue Spots, any type rewound, remagnetised and adjusted; 4/-; post free; mains transformer repairs; terms to trade.—Howell, 91, Morley Hill, Enfield, Middlesex. [9716

REPAIRS to Loud speakers, transformers and headphones, 4/-; Blue Spots or Wufas, 5/-, post free; moving coils a speciality, new cones fitted; eliminators and mains transformers quoted for; prompt service; satisfaction guaranteed; discount to trade.—Loud Speaker Repair Works, 5, Balham Grove, London. Battersea 1321. [0394

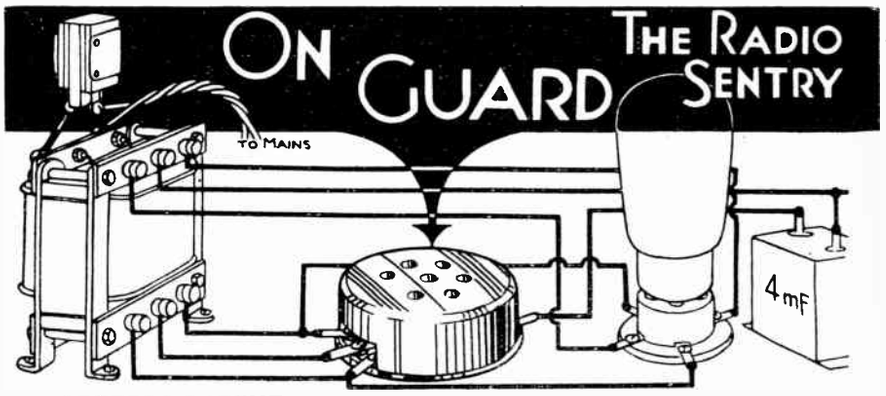
TUITION.

QUALIFIED Radio Engineers are Always in Demand, and our Home Study Course will enable you to qualify for a good post; many students already placed this season; prospectus free.—Northern Counties Wireless School, Preston. [0399

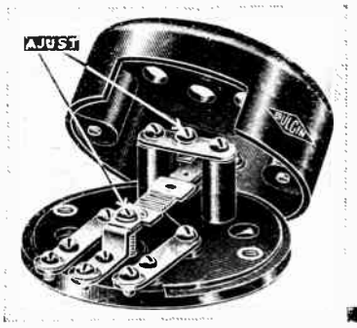
EXCHANGE.

EXCHANGE Your Set or Components for New; best allowance.—Radio Exchanges, 114, Roman Drive, Westcliff-on-Sea. [3556

HIGH Allowances Made on Second-hand Goods in Part Payment for New Sets or Components; easy payments available; we have tremendous stocks tested second-hand goods; send list of your requirements for quotation.—Bostock and Stonnill, 1, Westbourne Terrace, S.E.23. [3509



LETTERS PATENT No. 371,018.



BULGIN THERMAL DELAY SWITCH

Delays the application of H.T. to valves, until full emission is attained. Prevents production of peak voltages and damage to condensers, etc. New Seasons models fitted with adjustable contacts for any time period. The types listed cover every A.C. and D.C. requirement and will switch H.T. up to 500 Volts.

LIST No.	RATING OF HEATER
S.100	4 volts 0.1 amp.
S.101	.7.5 volts 0.5 amp.
S.111	.16 volts 0.25 amp.

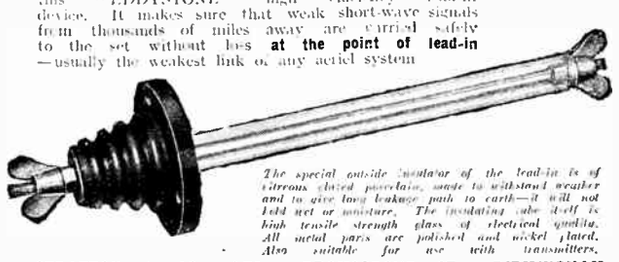
IMPROVE YOUR SHORT WAVE RESULTS

SHORT-WAVE ENTHUSIASTS will welcome this "EDDYSTONE" high efficiency lead-in device. It makes sure that weak short-wave signals from thousands of miles away are carried safely to the set without loss **at the point of lead-in** —usually the weakest link of any aerial system



The special outside insulator of the lead-in is of vitreous glazed porcelain, made to withstand weather and to give long leakage path to earth—it will not hold wet or moisture. The insulating tube itself is high tensile strength glass of electrical quality. All metal parts are polished and nickel plated. Also suitable for use with transmitters.

STRATTON & CO., LTD., BROMSGROVE ST., BIRMINGHAM.

FOUR SQUARE

"GRILLE"

Sept. 27th to Oct. 7th
Manchester Radio Exhibition.
STAND No. 103.

P.M.M.C. SPEAKER

A de luxe instrument embodying an entirely new development in Loudspeaker design. This consists of a unique suspension method for the diaphragm, consisting of resilient pads between which the periphery of the diaphragm is cushioned. These pads are held by the outer edge of the grille, thus eliminating all edge resonance and much of the usual suspension resonance. The design of the grille protects the diaphragm from damage by careless handling

High **Cobalt** content Magnet of generous cross section. Lacquered bronze finish. Highly finished Chromium-plated Grille. Specially impregnated cone. Chassis, Rust and Scratch proof finish.

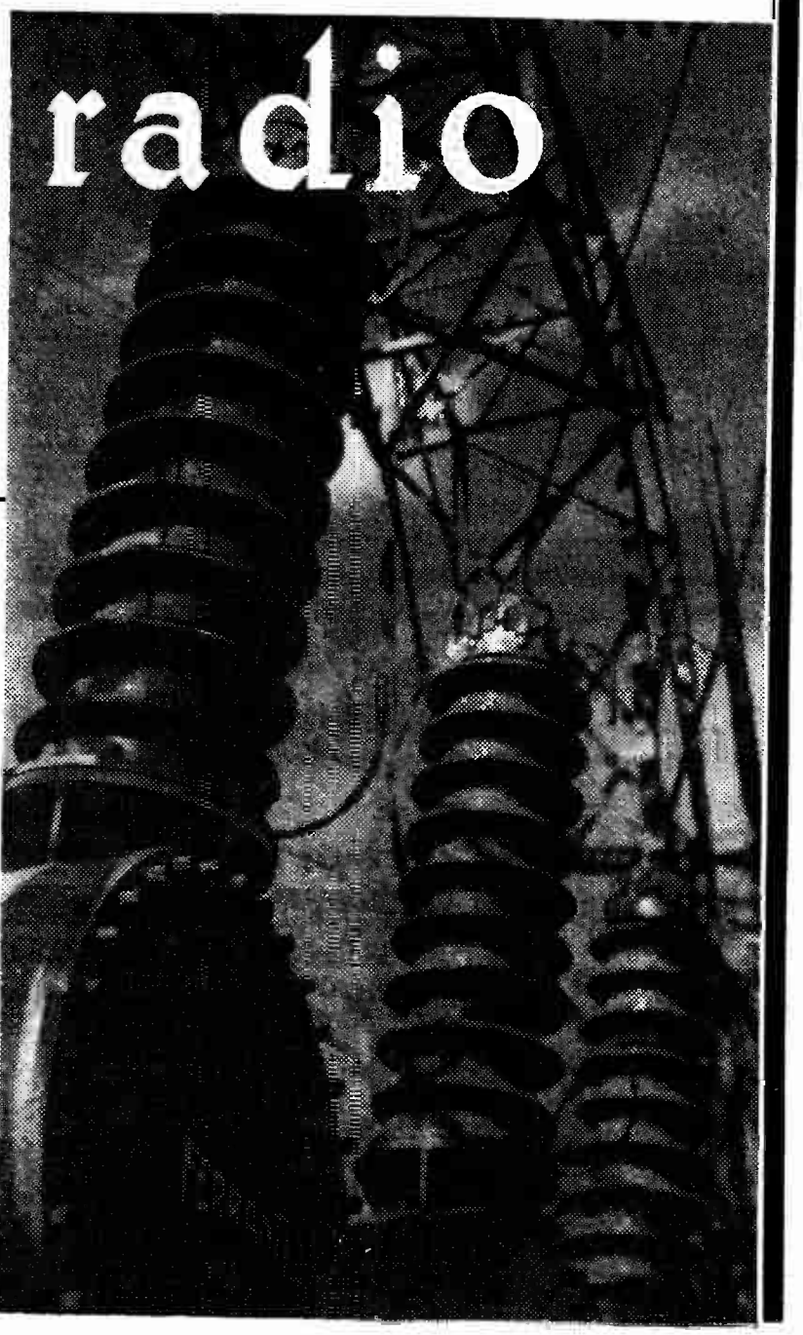
Elementary Principles of Wireless Telegraphy and Telephony. (Third Edition.) By post, 8/-.

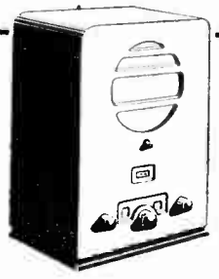
Exactly the same skill and care needed in the construction of a £15,000 Ferranti transformer are lavished on the building of a Ferranti Superhet costing 15 guineas. Ferranti radio will never fail you, never let you down. But that isn't all.

This year, Ferranti engineers have made radio very much simpler for you. First by means of Automatic Volume Control. This prevents "fading" on distant stations and maintains a steady volume for all programmes you tune in. Further, by Electric Tuning, which enables you to *see* when a station is accurately tuned in: an important advantage, since the human ear cannot always correctly tune in a highly sensitive Superhet. The Ferranti Radio Book fully describes these new technical advances and the Ferranti range of Superhets. Get a copy from your dealer, or send to ★ Ferranti Ltd., Hollinwood, Lancs, or Bush House, London.

FERRANTI

ELECTRICAL ENGINEERS TO THE 20th CENTURY





FERRANTI RANGE

ARCADIA CONSOLETTE **18** GNS

ARCADIA (illustrated)

A truly modern Superhet, small in size (the modern trend) but very powerful, having 7 tuned circuits, Ferranti Heptode oscillator-modulator valve and Double-diode-triode valve for full A.V.C. and improved undistorted detection. 2½ watt triode undistorted Output. Electric Tuning. Image Rejector to reduce second channel interference. Illuminated Station Name and Wavelength indicators. Energised moving coil speaker. Gramophone sockets. Manual volume control for both radio and gramophone. Continuously variable tone control.

COMPANIONETTE **20 GNS.** CONSOLE **23 GNS.**

LANCASTRIA

A Superhet similar in size and appearance to the Arcadia. Has all the new Ferranti valves, but one or two refinements are omitted for the sake of a remarkably low price.

CONSOLETTE **15** GNS

GLORIA

A larger cabinet than the Arcadia. Has all the new Ferranti features.

CONSOLETTE **24** GNS.

(CONSOLETTE with Ferranti synchronous clock built into speaker **26** gns.)
COMPANION **35** gns. CONSOLE **29** gns.

26
ELECTRON'S SUPER-AERIAL

Some "covered" wires are being boxed and made to look like SUPERIAL. Imitators know that the way to sell you another wire is to make it seem like SUPERIAL.

They imitate the box and the name, but they cannot imitate its vulcanized rubber insulation or the scientific combination of ferrous and non-ferrous metals (including copper). They offer you a stranded wire of one metal only which has a cheap and ineffective cotton "covering." This is not insulation and will not protect the aerial after a little exposure to weather. Some dealers try to deceive you. Avoid deception. DON'T BUY ANOTHER WIRE made to look like SUPERIAL. **That cheats you of something you prize.**

LOOK AT THE NAME AND THE BOX.

SUPERIAL is more than just an aerial—it is a very particular kind of aerial. It is a properly insulated aerial. It brings envied results, and does for your reception what every enthusiast wants—SELECTIVITY, VOLUME, BEAUTIFUL TONE. Imitations do not bring what you seek. They are NOT SUPERIAL.

TRY IT at our Expense and then you will know why it is so efficient. Ask your dealer for SUPERIAL — But you must agree to return it if it does not "prove up" to every claim made for it. We guarantee to refund your money unconditionally if SUPERIAL disappoints you. If your dealer does not stock SUPERIAL he can get it for you, or we will send it direct to you upon receipt of your remittance.

Good reception is worth any price you pay. Ask your dealer for SUPERIAL. You will get perfect reception and a £500 Free Lightning Insurance for two years from a Company which is in a position to meet all its obligations.

NEW

CLASS "A" QUALITY with CLASS "B" VOLUME

New form of bulb for rigidity of electrode anchoring.

Mica anchoring to glass bulb.

Unique form of duplicated grid construction.

Matched double triodes.

7 pin base.

SECTIONAL PHOTOGRAPH
Anode cut away to show grid construction.

OSRAM VALVE TYPE B.21

(For use in 2-volt Battery "Class B" Sets)

PRICE 14/- each

The Osram B21 double triode "Class B" valve sets a new standard of quality in "Class B" amplification.

NOTE THESE POINTS.

1. New and unique duplicated grid construction in each half of the double valve — giving a higher power output to input efficiency.
2. Characteristics — a combination of QPP and positive grid drive "Class B", giving freedom from distortion or spurious oscillation. This involves the use of negative grid bias.
3. Total filament consumption only 0.2 ampere.
4. Low H.T. current consumption.
5. New form of bulb for complete rigidity of electrode anchoring — small size and neat appearance.
